Introduction	I-IV.
Contributions to the Flora of Formosa I.	1-197.
On the systematic Position of <i>Mitrastemon</i> , as a Genus representing a special Tribus of the Rafflesiaceæ.....	199-213.
Index	215-222.
Plates.	I-XXXV.

INTRODUCTION

In the first and second fascicles of this work, I treated all Formosan plants belonging to families from the Ranunculaceæ to the Dipsacæ, and it was my desire to treat the remaining families in the present volume so as to complete the flora in the rather compact form of a conspectus. But the new materials with which I have been loaded down since last year, and especially the collections made by myself in my two excursions to the island (in 1912) are so numerous that it has required my whole time to work up even the first part of them, and this has compelled me to put off, for some years, the continuation of the conspectus appearing in the preceding fascicles. The present volume is, therefore, almost wholly devoted to the results of a study of the materials which have been worked up since last year, and the results are here given under the heading, "Contributions to the Flora of Formosa I." All the species are here arranged, as in the preceding volumes, after the system of BENTHAM and HOOKER.

The collections above referred to are really considerable, and it will apparently take my whole time for nearly two years more to work them up thoroughly. Consequently it is probable that two more volumes will be required to present the results of investigations of the materials which are now on my hands. The conspectus mentioned above will, therefore, I trust, be continued by 1915.

In the course of my studies since last year, I have found many new species to be added to the flora of Formosa. Among them, the following genera* are new to our flora.

Captis, represented by *C. Morii* HAYATA which is related to a Japanese species, *C. quenquefolia* MIQ.

Madeya, represented by *M. cordata* R. BR. which is widely distributed through China and Japan, but is rather rare in this island.

Eutrema, represented by *E. hederæfolia* F. et S. which is peculiar to Japan and Formosa.

Casearia, represented by *C. Merrillii* HAYATA, which is related to some Philippine species. The genus is mentioned under the Samydaceæ in BENTHAM and HOOKER's fundamental work.** In my opinion, however, it should be referred to the Bixineæ, so far as the present plant is concerned, after the limitation of the two families (Samydaceæ and Bixineæ) mentioned in the same work. The genus is referred to the Flacourtiaceæ § Casearieæ*** in ENGLER's system.

Salomonia, represented by *S. stricta* S. et Z. which exists only in Japan and Formosa.

Melandrium, represented by *M. morrisonmontanum* HAYATA and two other species, all endemic to the island.

Arenaria, represented by *A. petiolata* HAYATA which closely resembles *A. serpyllifolia* LINN.

Ryssopteris, represented by a Philippine species, *R. Cumingiana* A JUSS.

Chisocheton, represented by *Ch. kusukusense* HAYATA which is closely related to *Ch. hongkongense* TUTCHER.

Cassine, represented by *C. illiciifolia* HAYATA and two other species, all endemic to Formosa.

Pygeum, represented by a Philippine species, *P. Preslii* MERR.

Sanguisorba, represented by *S. formosana* HAYATA, which is very near to *S. officinale* LINN.

Osteomeles, represented by *O. anthyllidifolia* LINDL. The species is distributed in Japan, the Bonin, Sandwich, Maingaia, and Pitcairn Islands.

* It should be understood that I have not counted in these genera any genus outside of Formosa, though they are mentioned in this work.

** BENTHAM et HOOKER, Genera Plantarum I. p. 791.

*** ENGLER, A u. GILG. E., Syllabus der Pflanzenfamilien (1912) p. 268.

Ceriops, represented by a variety of *C. Cundolleana* ARN. The type is a native of the tropical shores of the Old World.

Monotropa, represented by *M. uniflora* LINN. The species is widely distributed in Northern India, Central China, Manchuria, Japan and North America.

Stimpsonia, represented by a *S. chamaedryoides* WRIGHT which is distributed in China, Korea and the Liu-Kiu Islands.

Geniostoma. A doubtful species of the genus is known from Kwa-shōtō Island.

Fagræa, represented by *F. Sasakii* HAYATA, which somewhat resembles *F. obovata* WALL.

Carpinus, represented by *C. Kawakamii* HAYATA and one other species, all endemic to Formosa.

Corylus, represented by a sterile specimen, closely related to *C. rostrata* var. *Sieboldiana* MAX.

Galeola, represented by a Malay plant, *G. altissima*.

Pinanga, represented by *P. Tashiroi* HAYATA which is closely related to a Philippine species, *P. Barnesii* BECC.

The species and varieties recently added or now to be added number as many as 211.*

Thus up to the present date, the total number of the flora, so far as is known, is 2918 species belonging to 881 genera and 158 families.

In the present volume, *Mitrastemon Kawasakii* HAYATA is mentioned under a family different from that to which it was formerly referred. As so great an alteration is a matter of importance, I have given my reasons under a separate heading, "On the systematic Position of *Mitrastemon*, as a Genus representing a special Tribus of the Rafflesiaceæ."

Though the scope of the present work is limited to the study of the Formosan flora, I have included some collections from

* It should be understood that plants outside of the island are not counted in this number.

Hainan, Liu-Kiu, and the Bonin Islands, as I consider them to be regions closely related botanically to Formosa.

My readers will notice that I have substituted the word "Volume" for "Fascicle" as used in the preceding portions of the *Icones Plantarum Formosanarum*, nec non et *Contributiones ad Floram Formosanam*. As each of these portions contains more than two hundred pages and thirty plates, the word "Volume" seems more appropriate than "Fascicle."

In conclusion, I avail myself of this opportunity to tender my hearty thanks to the officials of the government of Formosa, to whom I am much indebted for help in the collection of materials and in the publication of this work.

B. HAYATA.

March 31, 1913, Taihoku and Tōkyō.

Contributions to the Flora of Formosa

I.

Ranunculaceæ.

Clematis LINN.

Clematis alsomitrifolia HAYATA sp. nov. Volubilis; caulis teres leviter 15–16 sulcatus, internodiis 7 cm. longis, ramis angulo 90° divaricatis. Folia opposita bibernata, in circumscriptione rotundata vel oblonga, circ. 10 cm. in diametro, segmentis 9 oblongo-ovatis 4 cm. longis 2 cm. latis apice acutis vel breve acuminatis basi rotundatis vel rotundato-cordatis tenuiter coriaceis vel chartaceis 3– vel 5-nerviis, nervis basilaribus tenuissimis, nervis et venis utraque pagine elevatis, petiolis communibus 2 cm. longis vel longioribus, petiolulis ultimis 1–½ cm. longis. Flores paniculati, paniculis 10–15 cm. longis, terminalibus vel axillaribus, ramosis, ramis divaricatis angulo 90° divaricatis, ramis oppositis, bracteis cuspidatis. Flores maturi non visi. Sepala 4, extus hirsuta margine dense hirsuto-marginata, intus glabra, filamentis glabris, antheris elongatis apiculatis.

HAB. Formosa: Loco non indicato, leg. U. MORI, 1912, Aug.

Near *Cl. ovatifolia* Ito, but differs from it by the binate leaves and the leaflets with a roundly cordate base, and also in having much smaller flowers.

Clematis angustifolia HAYATA n.n.

Clematis Leschenaultiana DC. var. *angustifolia* HAYATA Materials for a Flora of Formosa p. 16.

Clematis dolichosepala HAYATA sp. nov. Scandens; caulis glaber, tenuiter sulcatus, internodiis 12–13 cm. longis. Folia simplicia vel 3-foliolata, petiolis in longitudine variabilis 2–7 cm. longis, foliolis in magnitudine variabilis 4–8 cm. longis ovato-triangularibus apice obtusis ad apicem brevissime apiculatis basi truncato-rotundatis ad extremitatem acutis ad

petiolum abeuntibus utrinque glabris membranaceo-chartaceis margine integris 3-nerviis, nervis supra impressis subtus tenuissime elevatis apice convergentibus ad summum laminarum attingentibus, interdum præterea nervis basilaribus tenuissimis 2 additis. Flores axillares solitarii longe pedunculati, pedunculis 10 cm. longis supra basin bracteis oppositis instructis, bracteis oblanceolatis 1-2 cm. longis apice apiculatis basi attenuatis. Sepala 5, lanceolato-oblonga, $3\frac{1}{2}$ cm. longa, $1\frac{1}{2}$ cm. lata, apice rotundata, ad summum obtuso-apiculata, basi sensim angustata, 3 mm. lata, 7-nervia, extus brevissime denseque hirsuta, intus glabra. Stamina ∞ , $1\frac{1}{2}$ cm. longa, filamentis glabris, antheris linearibus 5 mm. longis apice apiculatis. Carpella ∞ , stylo longe sericeo-barbato.

HAB. Hieranzan, leg. S. SASAKI, Feb. 1910, (Fl.).

Near *C. akoensis* HAYATA, but differs from it by the much longer sepals and ovately triangular leaves.

Clematis Henryi OLIV. var. **leptophylla** HAYATA n. v. Scandens, caulis glaber, tenuiter sulcatus, fusco-rubescens. Folia opposita membranacea, simplicia, ovato-lanceolata, in magnitudine variabilima mediocria 15 cm. longa, 5 cm. lata, apice acuminata vel acuminatissima, basi latissima, rotundata rotundato-truncata vel cordata, margine deorsum integra, sursum remote serrata romote mucronato-serrulata vel subintegra, trinervia, præterea 2 tenuissimis nervis addita, utraque glabra, petiolis longis laminam $\frac{1}{2}$ plo in longitudine æquantibus. Flores axillares solitarii vel gemini, pedunculis 3-5 cm. longis interdum deorsum 2- 3-nodosis, ad nodos breve bracteatis, (bracteis oppositis triangulari-lanceolatis hirsutis 2 mm. longis), apice dilatatis. Flores non patentes, semiclausi, vel campanulati, 2 cm. longi, totiusque lati. Sepala 4, ovato-triangularia, 2 cm. longa, 11 mm. lata, apice acuta, margine plicata, partibus plicatis 2 mm. latis, extus brevissime hirsuta, intus glabra sed sursum leviter brevissime hirsuta, basi rotundata- vel rotundato-cordata, basi 2 mm. lata. Stamina ∞ , 3-seriata, $1\frac{1}{2}$ cm. longa, filamentis complanatis, $\frac{2}{3}$ mm. latis, 1-nervatis, margine longe sericeo-barbatis barbis 3-4 mm. longis, antheris oblongis $2\frac{1}{2}$ mm. longis 1 mm. latis apice obtuse acutis. Carpella ∞ , 1 cm. longa sericeo-barbata. Achænia complanato-oblonga facie hirsuta basi

breve rostrato-acuta, apice attenuata ad stylum abeuntia, $3\frac{1}{2}$ mm. longa
 $1\frac{1}{2}$ mm. lata.

HAB. Arisan, leg. B. HAYATA et S. SASAKI, Jan. 1912.

Differs from the type by the much thinner and less serrate leaves.

Clematis insulari-alpina HAYATA sp. nov. (Fig. 1.) Scandens, caulis
glaber tenuissime pluri-sulcatus, internodiis 7 cm. longis, foliis et floribus

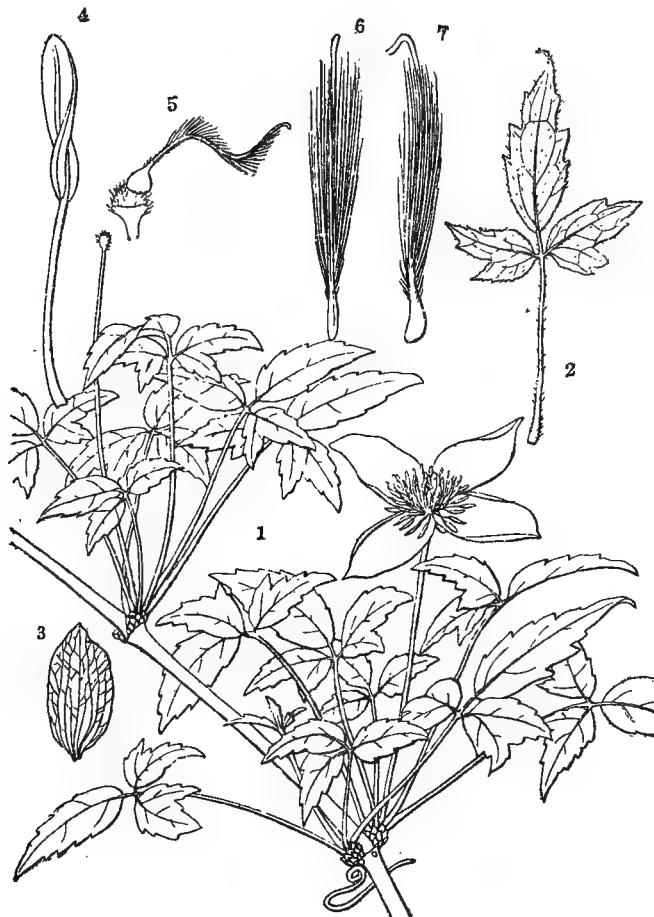

Fig. 1.

Clematis insulari-alpina HAYATA. 1, the plant; 2, a leaf; 3, a sepal; 4, a stamen; 5, a carpel on the receptacle; 6, 7, carpels. Fig. 1, 2 and 3 $\times \frac{7}{9}$; fig. 4, 5, and 7 more or less magnified.

ad nodos fasciculatis vel ad basin ramorum fasciculatis. Folia ad nodos caulis (vel basin ramorum et florum) fasciculata, trifoliolata, triangularia in circumscriptione, communibus petiolis $3\frac{1}{2}$ cm. longis hirsutis basi leviter dilatatis intus late sulcatis, foliolis lateralibus sessilibus vel breve petiolulatis, foliolis terminalibus petiolulatis, petiolulis 5 mm. longis; lamina folioli terminalis ovato-lanceolata, $3\frac{1}{2}$ cm. longa $1\frac{1}{2}$ cm. lata, apice acuminata, basi cuneata, tenuiter 3-lobata, vel inciso-serrata, utraque hirsuta. Flores ad nodos caulis fasciculati, (sæpe 1-5) longe pedunculati, pedunculis $7\frac{1}{2}$ cm. longis, tenuiter sulcatis hirsutis. Sepala 4, oblonga, apice obtusa ad sumnum breve euspidato-apiculata, basi contracta, 28 mm. longa, 13 mm. lata, basi 2 mm. lata, extus hirsuta intus glabra 7-nervia, patentia. Stamina ∞ , 10-8 mm. longa, antheris linearibus, $3\frac{1}{2}$ mm. longis $\frac{2}{3}$ mm. latis, apice rotundato-obtusis, basi obtusis. Carpella ∞ , stylo longe albo-sericeo-barbato, stigmate semi-clavato.

HAB. Montibus Formosae, leg. U. MORI, Juli. 1912.

Near *C. Pierotii* Miq., but differs by the broader sepals and much more hirsute leaves.

Thalictrum LINN.

Thalictrum micrandrum HAYATA sp. nov. (Tab. I.) Herba cæspitosa, radicibus interdum tuberiferis, tumoribus clavatis $1\frac{1}{2}$ cm. longis, interdum non tuberiferis. Caulis cæspitosus gracillimus 30 cm. altus pauciramosus, sub ramis 1-foliatus. Folia radicalia cum petiolis 25 cm. longa, (petiolis 18 cm. longis) late reniformia in circumscriptione, tri-ternatim pinnata, pinna terminali cum iis lateralibus conformi et æquilonga, pinnulis ultimis petiolulatis, petiolulis cum laminis æquilongis, angulo recto divaricatis; laminis obovato-cuneatis late rhomboideis vel late cordatis, variabilibus in magnitudine, 1-2 cm. longis, margine deorsum integris sursum leviter 5-lobatis, margine desuper tenuissime recurvis, 3-5-nerviis, nervis et venis supra tenuissime, subtus prominente elevatis; petiolis communibus supra sulcatis basi dilatatis, stipulis intrapetiolaribus cum petiolis connatis tenuissimis nigricantibus 3 mm. longis margine et apice erosionis. Folia caulina biternata, (petiolis communibus 1 cm. longis vel interdum 0) triangularia in circum-

scriptione 6 cm. longa totiusque lata, laminis pinnularum ultimarum obovato-cuneiformibus, 1–2 cm. longis, versus apicem 3-lobatis. Flores ad apicem ramorum solitarii. Sepala 4, obovata, 3 mm. longa, 2 mm. lata, apice truncata, basi contracta $\frac{1}{3}$ mm. lata, valde concava, 3-nervia, interdum 2 nervis tenuissimis, addita, nervis lateralibus sursum furcatis. Stamina ∞ , brevissima, 1 $\frac{1}{2}$ mm. longa, filamentis 1 mm. longis apice clavatis linearibus antheram in longitudine 2-plo æquantibus, antheris late oblongis $\frac{2}{3}$ mm. longis. Carpella fusiformia stipitata, 1 $\frac{1}{2}$ mm. longa. Achenia recta, fusiformia longe stipitata, cum stipitibus 4 $\frac{1}{2}$ –5 mm. longa (stipitibus 1 $\frac{1}{3}$ mm. longis), prominente 4-costata, inter costas 1-costulata.

HAB. Kinkwaseki, leg. Y. SHIMADA, 1912, Mai.

Near *T. Fauriei*, but differs from it by the much narrower and shorter filaments of the stamens and much larger form of the plant.

Thalictrum Morii HAYATA sp. nov. Caulis solitarius vel pauci-(1–2) fasciculatus, 15 cm. altus, glaberrimus, subteres sursum 1–2-ramosus, sursum 1-foliatus. Folia radicalia 2–3–4, cum petiolis 10 cm. longa, 2-plo vel 3-plo ternatim pinnata, excepto petiolo 4 cm. longa totiusque lata triangularia in circumscriptione, pinnulis ultimis cuneato-obtriangularibus circ. 1 cm. longis sursum trilobatis, (lobis obtusis rursus 3-lobulatis) obscure trinerviis, venis laxe reticulatis, nervis et venis utraque page elevatis, subtus marginatis, membranaceo-chartaceis, petiolis communibus 6 cm. longis supra \pm sulcatis basi dilatatis, stipulis tenuissimis membranaceis adnatis intrapetiolaribus apice integris. Folia caulina sessilia, 3-foliolata, petiolulis 6 mm. longis, foliolis cuneato-ovatis rursus 3-lobatis 1 cm. longis. Flores ad ramos terminales. Sepala obovato-oblonga, 5 mm. longa, 2 mm. lata, apice truncato-obtusa, basi \pm angustata, ad insertionem $\frac{1}{3}$ mm. lata, trinervia. Stamina ∞ , filamentis apice clavato-dilatatis, antheris elongato-ellipticis apice truncato-emarginatis basi lobato-emarginatis $\frac{2}{3}$ mm. longis. Carpella ∞ fusiformia, \pm obliqua, stipitata, stylo brevi apice complete recurvo stigmatoso.

HAB. Tonkurankei, leg. U. MORI, Aprili. 1910.

Near *T. Fauriei* HAYATA, but differs by the longer anthers and cuneately based leaves.

Thalictrum sessile HAYATA sp. nov. (Fig. 2.) Herba 60 cm. alta, caulis glaber in exsiccato pluri-sulcatus supra medium furcatim ramosus. Folia radicalia non visa, caulina rotundato-triangularia, 15 cm. longa, (petiolis communibus 4 cm. longis, basi dilatatis caulem semiamplexantibus), ternatim pinnata, pinnis lateralibus 8 cm. longis rursus pinnatis, pinnulis ultimis obovato-rotundatis 22 mm. longis totiusque latis apice 5-lobatis basi late cuneatis, lobis oblongis apice rotundatis, mediis majoribus, subtus pallidioribus, pinnulis lateralibus minoribus obliquis oppositis petiolulis ultimis latelaribus 5 mm. longis, iis terminalibus 15 mm. longis. Flores versus apicem ramorum cymose laxe dispositi, pedicellis ultimis 1 cm. longis. Flores apertentes non visi. Receptaculum fructiferum clavato-globosum $\frac{1}{3}$ mm. in diametro. Staminae filamenta apice \pm dilatata, claviformia, antheris oblongis $\frac{2}{3}$ mm. longis $\frac{1}{2}$ mm. latis apice apiculatis. Carpella matura sessilia ellipsoidea, fusiformia, \pm complanata, 8-costata, 3 mm. longa, 1 mm. lata, basi contracta, apice subito attenuata, ad stylum persistentem apice recurvum $1\frac{1}{2}$ mm. longum abeuntia.

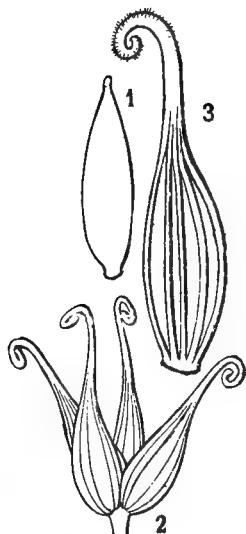

Fig. 2.

Capparis leptophylla HAYATA sp. nov. Frutex. Rami teretes subrecti, tenuissime pubescentes, brevissime remoteque spinosi, spinis recurvis $1\frac{1}{2}$ mm. longis apice acutis basi dilatatis. Folia alterna membranacea, lanceolata 10 cm. longa 3 cm. lata, apice acuminata ad summum obtusa, basi obtusa, margine subintegra, costis supra impressis vel tenuiter sulcatis subtus elevatis, venis et venuis utraque elevatis reticulatis, venis primariis lateralibus numerosis utroque latere costæ 10–20, utraque page glabra, petiolis 5 mm. longis supra tenuiter sulcatis, spinis utroque latere basis petiolorum dispositis. Flores solitarii, supra-axillares, a axilla foliorum 3 mm. remoti, pedicellis 6 mm. longis erectis tenuissime pubescentibus. Sepala 4; oblonga valde concava, 8 mm. longa in explicatio 5 mm. lata, glabra vel ad apicem leviter pubescentia. Petala 4, obovata oblongo-rectangularia, 10 cm. longa $4\frac{1}{2}$ mm. lata, apice rotundata basi angustata, intus glabra, extus pubescentia. Stamina ∞ numerosae filamentis 18 mm. longis, antheris oblongo-linearibus 2 mm. longis utrinqu, obtusis. Ovarium longe stipitatum, (stipite 3 mm. longo), ovoideo-conicum 2 mm. longum, 1 mm. latum apice acutum. Fructus ignotus.

HAB. Akō : Mankinshō, leg. S. SASAKI, Mart. 1910.

Near *C. membranacea* but differs from it by the much thinner leaves and shorter prickles.

Capparis oligostema HAYATA sp. nov. Frutex scandens? Rami glabri subrecti vel subflexuosi, inermi, cortice lœvi flavo-fuscenti tilongitudinaliter rugoso. Folia oblongo-ovata vel oblongo-obovata, $5\frac{1}{2}$ cm. longa $3\frac{1}{2}$ cm. lata, apice obtusa ad summum obscure mucronata vel obtusa, basi obtusa vel rotundata, crassiuscula exsiccati coriacea viridiscentia, utraque glabra secundum costam tenuiter plicata, costa supra plana vel sulcata subtus elevata, venis lateralibus tenuissimis supra \pm elevatis subtus non conspicuus, margine integerima leviter desuper recurva, petiolis brevioribus $1-1\frac{1}{2}$ cm. longis intus sulcatis. Flores parvi umbellato-paniculati, paniculis terminalibus

vel axillaribus 5 cm. longis. Sepala 4? oblongo-rotundata. Petala 4? oblonga. Stamina 8, anthera oblongo-linearis apice apiculata. Ovarium stipitatum. Fructus baccatus longe pedicellatus et stipitatus, globoso-ovoideus verucosus, cum stipitibus 3 cm. longus 12 mm. latus apice truncatus basi subito attenuatus ad stipitem 6-7 mm. longum abeuns, generaliter 2-spermus.

HAB. Kōshūn, Kuraru, Mai. 30, 1912, leg. B. HAYATA, (Fl.); leg. S. KUSANO, Jan. 1909, (Fr.).

Remarkable for the smallness of flowers and the paucity of stamens which are as few as eight in one flower.

Capparis tenuifolia HAYATA sp. nov. Rami subglabri, minute striati, subrecti. Folia crassiuscula, in exsiccato membranacea, tenuissima, alterna, ovata vel ovato-oblonga, 7 cm. longa, 3 cm. lata, apice acuta ad sumnum obtusa, basi obtusa, venis venulisque tenuissimis, utraque glabra, margine integra. Flores geminatim superpositi, axillares, pedicellis 17 mm. longis erectis. Sepala 4, altra 2 majora valde concava 5 mm. longa 3 mm. lata utrinque glabra, altra 2 minora, apice pubescentia. Petala 4, obovato-oblonga, 6 mm. longa, 3 mm. lata, apice rotundata, basi acuta, intus glabra, extus pubescentia. Stamina 8, antheris oblongo-linearibus 1½ mm. longis. Ovarium longe stipitatum, (stipite 2 cm. longo), ovoideo-conicum 1 mm. longum, apice acutum.

Polygala LINN.

Polygala crassiuscula HAYATA sp. nov. Suffrutescens glabra, 20 cm. alta, sœpe simplex, rarius paucissime ramosa. Folia lanceolata, alterna, crassiuscula, in exsiccato membranacea, 6 cm. longa, 17 mm. lata, apice acuta vel acuminata ad summum tenuiter aristata, basi obtusa, margine integra sed versus apicem minute aristato-ciliolata, subtus pallidissima, venis lateralibus utroque latere 3-4 arcuatis apice eam superiorem proximam attingentibus, petiolis 12 mm. longis. Flores purpurei? racemosi, racemis terminalibus 5 cm. longis dense floratis, bracteis lanceolatis $1\frac{1}{2}$ -2 mm. longis, pedicellis 2-3 mm. longis desuper recurvis apice dilatatis. Sepala 5, exteriora 3, interiora 2, decidua; supremum exteriorum sepalorum globosum saccatum majusculum rotundatum 3 mm. longum; 2 inferiora exteriorum sepalorum late rotundata basi oblique leviter cordata $1\frac{1}{2}$ mm. longa; 2 interiora petaloidea oblique obovata $7\frac{1}{2}$ mm.

longa 4 mm. lata apice rotundata, basi cuneata valde concava. Petala alte coalita, lateralia arcte imbricata 8 mm. longa 2 mm. lata apice rotundata, medio plicato-reflexa basi oblique rotundata, carina latere interiore connata apice cristam 1½ mm. longam digitiformem gerens, digitis incrassatis. Ovarium glabrum breviter stipitatum (disco late annulari) rotundatum obcordatum 2 mm. latum valde complanatum, margine subalatum. Stigma inaequale superne breve dentiforme apice punctiforme inferne subdilatatum concavum acutum. Stylus apice dilatus, infra stigma appendiculatus. Capsula ignota.

HAB. Montibus centralibus: Arisan, leg. S. SASAKI, Jan. 1911.

Near *P. arcuata* HAYATA and *P. nimborum* DUNN (in Fl. Kwangt. and Hongk. p. 39); but differs from the former by the larger light purple flowers and smaller leaves, and from the latter by the smaller leaves with very much fewer lateral veins.

Polygala stenophylla HAYATA sp. nov. Suffrutescens. Caulis erectus rectus, simplex eramosus, toto longitudine foliatus, 30–40 cm. longus, gracillimus, teres, 1 mm. in diametro sectionis, flavescens, glaber. Folia alterna, subsessilia, lanceolata linearia vel lineari-lanceolata, 3 cm. longa, 3 mm. lata, apice acuta vel obtusa, basi obtusa, suberecta utrinque glabra, membranacea, supra tenuissime reticulata, subtus pallida, petiolis brevibus 1 mm. longis vel brevioribus. Racemi simplices terminales 5–6 cm. longi, laxè florati, pedicellis 2–3 mm. longis basi 2-bracteatis, bracteis minutis ovatis 1 mm. longis. Sepala exteriora 3, subæqualia oblonga, 2½ mm. longa, valde concava, interiora obovata 5 mm. longa, 3 mm. lata, apice rotundata, basi subito cuneata obliqua ± concava. Petala lateralia ascendentia, oblonga 5 mm. longa, 1½ mm. lata, a medio co-forme contracta, basi cum carina coalita, supra basin libera, intus deorsum hirsuta, apice obscure 2–3-lobulata obliqua, carina sublibera basi unguiculata cum cristam 7 mm. longa 2½ mm. lata complete latere interiore connata, unguis 2½ mm. longis, laminis basi superne auriculatis, cristis 5-fidis, segmentis alte multi-fimbriatis. Stamina 8, vagina staminum lata, explicatio 1½ mm. lata 3½ mm. longa. Ovarium breve stipitatum obcordatum, stigmata inaequalia, superius sessile, inferius late stipitatum, stipite complanato ¾ mm. longo, utrumque pectinatum.

HAB. Fôkien : Kosan, leg. S. NAGASAWA, Aprili. 1910, (No. 226).

Near *P. hongkongensis* HEMSL. (Ind. Fl. Sin. I. p. 60, Pl. II.), but differs from it by the much narrower leaves and 2 distinctly lobed stigma; also near *P. tenuifolia*, but distinguishable from it in having broader leaves and terminal racemes.

Caryophylleæ.

Dianthus LINN.

Dianthus pygmæus HAYATA sp. nov. Herba nana 6–7 cm. alta, rhizomatibus gracilibus pauci-ramosis; caulis simplex, erectus, rectus. Folia radicalia ad basin caulis approximativi dense disposita, linearia 23 mm. longa 1½ mm. lata, apice acuta, basi longe attenuata in basi dilatata caulem semi-amplectantia, margine tenuissime marginata, et sub lente minute denticulata, sessilia. Folia caulina radicali similia, decussatim 3-seriatim remote sita, superioribus minoribus. Flores sub-sessiles erecti, basi bracteis oppositis 2-seriatim decussatis instructi, bracteis inferioribus ovatis apice longe cuspidatis 1 cm. longis 3½ mm. latis basi æquilatis margine hyalinis, superioribus oblongis apice breviore cuspidatis basi obtusis 12 mm. longis 5 mm. latis margine hyalinis. Calyx cylindricus, 18 mm. longus 3½ mm. latus, multi-striatus, ore 5-labatus, lobis triangulari-ovatis 4 mm. longis 2½ mm. latis leviter patentibus extus glabris intus pubescentibus margine breviter ciliolatis apice obtusis. Petala 5, longe unguiculata cum ungue 3 cm. longa, unguibus linearibus 17 mm. longis 1 mm. latis, lamina rotundato-ovata 13 mm. longa 12 mm. lata patento-reflexa a medio sursum alte fimbriata, (fimbriis sæpe simplicibus, nunquam furcatis, 8 mm. longis basi ½ mm. latis omnino 10, radiatim divergentibus), basi cuneata integra. Stamina 10 basi in tubum brevem 1 mm. longum connata, supra basin libera, filamentis altris 6 mm. longis altris 4 mm. longis, antheris linear-i-oblongis 1 mm. longis ½ mm. latis apice arete 2-lobatis basi sagittatis. Capsula (submatura) stipitata, stipite 1 mm. longo cum tubo staminum æquilongo, cylindracea 8 mm. longa 2½ mm. lata supra medium latissima glabra apice obtusa, cum stylo articulata, stylis 2, distinctis 9 mm. longis, linearibus intus hirtellis. Semina minuta.

HAB. In monte Morrison, ad 13000 ped. alt., leg. T. KAWAKAMI et U. MORI, 1908, Oct. (No. 2259).

Near *D. superbus* LINN., but differs from it in having much shorter calyx-tube and less fimbriate petals.

Silene LINN.

Silene Morii HAYATA sp. nov. Caulis plus 70 cm. altus, tetragonous facie leviter sulcatus hirsutus, ad nodos leviter prominulus. Folia lanceolata 4 cm. longa $\frac{1}{2}$ cm. lata, apice acuta, basi leviter angustata, æquilatera utraque pagine hirsuta, 3-nervia, nervis parallelis. Flores cymosi, pauciflorati, longe pedicellati, erecti, pedicellis $3\frac{1}{2}$ cm. longis. Calyx cylindrico-obconicus, 1 cm. longus apice 5mm. latus extus hirsutus intus glaber 10-nervius apice 5-lobatus, lobis oblongis 3 mm. longis 2 mm. latis apice obtusis margine ciliatis intus glabris extus hirsutis. Petala 5, longe spatulata, 1 cm. longa, cum calice æquilonja, $2\frac{1}{2}$ mm. lata, apice latissima, 2-lobata, (lobis oblongis $1\frac{1}{2}$ mm. longis apice rotundatis 1 mm. latis basi æquilateris, sinibus interlobos obtusis), deorsum cuneato-attenuata, ad basin $\frac{1}{2}$ mm. lata, margine sursum integra, ad summum dentibus obtusis tenuibus 1- vel 2 utroque latere apicis instructa, deorsum integra a medio deorsum longe ciliata sursum non ciliata 3-nervia, sursum grosse reticulata. Stamina 10, 8 mm. longa, antheris oblongo-ovatis basi tenuiter lobatis $\frac{2}{3}$ mm. longis. Ovarium cylindricum, stylis 3 brevibus 2 mm. longis.

HAB. Jyōgesha, leg. U. MORI, 1910, April.; Namshiseimansha, 1908, Mart.

Silene mushænsis HAYATA sp. nov. Caulis altus. Folia lanceolato-oblongo-ovata 5 cm. longa $1\frac{1}{2}$ cm. lata apice acuta basi attenuata in basi 4 mm. lata, utraque pagine hirsuta, costis et venis inconspicuis. Flores oppositum superpositum cymosi, pedicellis pubescentibus. Calyx cylindrico-oblongus, 8 mm. longus, apice 6 cm. latus, 10-nervius, extus pubescens intus glaber, apice 5-lobatus, lobis patentibus reflexis triangularibus 2 mm. longis apice obtusis vel acutis margine ciliatis. Petala 5 cuneato-ovata, 8 mm. longa, $3\frac{1}{2}$ mm. lata, apice tenuiter 4-lobata, (lobis 2 lateralibus obscuris, 2

centralibus $1\frac{1}{2}$ mm. longis apice obtusissimis), intus facie prope apicem supra medium obscure 2-squamata, basi cuneato-attenuata, 3-nervia. Stamina 10, petalis breviora, stylis 3.

HAB. Nantō: Musha, leg. U. MORI, Jan. 1908.

Differs from *S. Morii* HAYATA by the much broader leaves and 4-lobed petals. Also near *S. firma*, but distinguishable from it in having less emarginate petals and in the markings of seeds.

Melandrium ROEHL.

Melandrium morrisonmontanum HAYATA sp. nov. Perennis. Rhizomata gracilia repentina, apice caules 5–6 gerentia. Caulis gracilis simplex teres subscandens, $\frac{1}{2}$ –1 mm. in sectionis diametro, brevissime hirsutus, toto longitudine foliatus. Folia linearia angustissima opposita $2\frac{1}{2}$ –3 cm. longa, $2\frac{1}{2}$ mm. lata, apice acuta, basi æquilata, caulem semi-amplectantia, in exsiccato utraque pagine minute tuberculata, costis supra impressis inconspicuis, subtus elevatis distinctis, venis et venuulis inconspicuis, margine tenuissime marginata, ad marginem sub lente minute serrulata. Flores terminales, solitarii, pedicellis 6 mm. longis dense pubescentibus, pilis retrorsis, basi bracteis 2 instructis, bracteis foliaceis lanceolatis 13 mm. longis $2\frac{1}{2}$ mm. latis apice acuminatis utraque pagine glanduloso-punctatis margine ciliolatis, ciliis patentibus vel retrorsis. Calyx inflatus, breve cylindrico-campanulatus, 18 mm. longus apice latissime 12 mm. latus, basi interior intrudens 5 mm. latus, extus intusque præsertim ad nervos hirsutus, 5-nervius, et 5-internervis, tenuibus instructus, tenuiter semi-hyalinus, apice 5-lobatus, lobis triangularibus 5 mm. latis 4 mm. longis, versus apicem alis dilatatis margine apice ciliolatis deorsum non ciliolatis integris instructis, dorso apice costatis. Torus 4 mm. longus cum gynophora 6 mm. longus, gynophoris $1\frac{1}{2}$ mm. longis. Petala 5, longe unguiculata, cum unguibus 2 cm. longa, unguibus cum calyce æquilongis 12 mm. longis apice dilatatis laminiformibus obovatis deorsum linearibus, (partibus dilatis trinervis obovatis 5 mm. longis $4\frac{1}{2}$ mm. latis subito attenuatis ad linearem abeuntibus), deorsum linearibus $\frac{1}{2}$ mm. latis; laminis obcordatis grosse reticulatis 7 mm. longis quam ungue brevioribus apice 7 mm. latis a medio sursum furcatim 2-lobatis, (lobis oblongo-rectangularibus 4 mm.

longis $2\frac{1}{2}$ mm. latis apice obtusis, sinibus interlobos acutis vel obtusis, lobis a se angulo 45° divaricatis basi æquilateralibus) basi cuneato-attenuatis, basi $1\frac{1}{2}$ mm. latis squamis 2 instructis, squamis oblongis rectangularibus 2 mm. longis 1 mm. latis basi æquilateralibus apice obtusis. Stamina 10, cum unguibus petalorum æquilonga. Ovarium oblongum, (gynophoris $1\frac{1}{2}$ mm. longis) $3\frac{1}{2}$ mm. longum 2 mm. latum, styli 3. Fructus ignoti.

HAB. Monte Morrison, leg. S. SASAKI, Oct. 1909.

Melandrium transalpinum HAYATA sp. nov. Perennis. Caulis cæspitosus ascendens, simplex 10 cm. altus toto longitudine foliosus, minute tuberoso-hirsutus, ad nodos plus minus tumidus. Folia linearia internodium æquantia $1\frac{1}{2}$ em. longa $1\frac{1}{2}$ mm. lata, apice acuminata, basi attenuata, cum eo opposito connata vaginam 2 mm. longam formantia, utraque pagine minute tuberculata, margine ciliolata. Calyx cylindrico-obconicus, 13 mm. longus, 1 cm. latus, erectus, basi interior intrudus, extus hirsutus intus subglaber, 5-nervatus, apice 5-lobatus, lobis triangularibus $3\frac{1}{2}$ mm. longis 4 mm. latis apice obtusis medio sursum margine ciliatis intus integris. Petala longe unguiculata, cum unguibus 16 mm. longa, (unguis 1 cm. longis sursum gradatim ad laminam abeuntibus, apice $3\frac{1}{2}$ mm. latis basi attenuatis cuneiformibus), lamina 7 mm. longa apice 6 mm. lata apice alte furcatim 2-lobata (lobis rectangularibus apice truncatis $3\frac{1}{2}$ mm. longis 2 mm. latis), basi leviter angustiore ad unguim abeunte vel ad basin contracta squamis 2 instructa, squamis late rectangularibus $2\frac{1}{2}$ mm. latis $1\frac{1}{2}$ mm. longis apice truncatis margine denticulatis. Stamina 10. Torus validus tementosus $2\frac{1}{2}$ mm. longus, gynophoris 10 mm. longis. Styli 4.

HAB. In montibus centralibus, leg. U. MORI et S. KATÔ, Dec. 1909.

Near *M. morrisonmontanum* HAYATA, but differs from it in having smaller leaves, broader petals and in its smaller form.

Melandrium vesiculiforme HAYATA sp. nov. Caulis basi prostrato-scandens, solum basi ramosus, ramis ascendentibus simplicibus, 30–40 cm. longis, cortice inferne minute tuberculato, sursum dense retrorse hirsutus, in toto longitudine foliatus. Folia opposita, linearia cum internodiis æquilonga,

5 cm. longa 2-2½ mm. lata, apice acuminata, basi leviter angustata cum eo opposito connata vaginam 2½ mm. longam formantia, utraque pagine minute tuberculata, margine ciliolata, costis subtus elevatis. Flores terminales, solitarii. Calyx inflatus, subglobosus, vel globoso-campanulatus, 1½ cm. longus totiusque latus, apice 5-lobatus, (lobis erectis triangularibus 7 mm. latis 5 mm. longis apice obtusis leviter dilatatis margine sursum dense ciliatis; deorsum nervoso-emarginatis non ciliatis integris), 5-nervatus tenuis, semi-hyalinus, utraque pagine præsertim ad nervos dense hirsutus, grosse reticulatus, basi interiore intrudus. Petala 5 longe unguiculata, cum unguibus 2 cm. longa, (unguis 12 mm. longis calycem subæquantibus, longe linear-i-cuneiformibus apice 4 mm. latis deorsum sensim attenuatis basi 1 mm. latis medio trinerviis); lamina patente obcordata 8 mm. longa apice 7 mm. lata, apice alte furcatim 2-lobata, (lobis late oblongis 4 mm. longis totiusque latis apice rotundatis basi æqualibus grosse reticulatis) basi cuneata, basi usque ad 2 mm. in lato contracta, basi callis 2 globosis et supra eos squamis 2 instructa, squamis flabelliformibus 1½ mm. longis longitudinaliter plicatis, apice lobulatis. Stamina 5 cm. longa calycem æquantia. Torus 2½ mm. longus validus tomentosus, gynophoris 1 mm. longis hirsutis. Styli 4.

HAB. In Mt. Morrison, 12000 ped. alt., leg. S. SASAKI.

Near *M. morrisonmontanum* HAYATA, but differs from it by the longer leaves, much more swollen calyx and broader petals.

Arenaria LINN.

Arenaria petiolata HAYATA sp. nov. Herba tenuissima 10-20 cm. longa, prostrato-scandens. Caulis tenuiter et breviter retrorso-pubescent vel subglabrus. Folia opposita ovato-spathulata, subpetiolata, 12 mm. longa 5 mm. lata, apice obtusa, basi subito attenuata, ad petiolum 4 mm. longum abeuntia, tenuissima, utraque parce hirsuta, margine ciliata, petiolata, sed superiora subsessilia. Flores cymose subsolitarii, pedicellis 1 cm. longis. Sepala inæqualia altra oblonga, altra lanceolata 4 mm. longa, 1-1½ mm. lata, dorso prominente costata, margine hyalina, altra ciliolata, altra non ciliolata. Petala 5 quam sepalis multo breviora oblonga brevissime unguiculata, 1½-1

mm. longa apice obtusa, inclusa. Stamina 10. Styli 3. Capsula oblonga 3 mm. longa, carpellis 3, apice bifidis.

HAB. Nanto, Mart. 1910, leg. T. KAWAKAMI.

Near *A. serpyllifolia* LINN., but differs from it by the petiolate leaves and very much smaller petals.

Sagina LINN.

Sagina echinosperma HAYATA sp. nov. Herba humilis; caulis foliifer erectus brevis a basi caulem floriferum emittens, omnino glaber. Folia caulis foliiferi linearis-filiformia erecto-patentia, 18 mm. longa, $\frac{1}{2}$ - $\frac{2}{3}$ lata, margine parce ciliolata basi cum iis oppositis connata. Folia caulis floriferi breviora 8 mm. longa. Flores cymose subsolitarii, pedicellis 2 cm. longis. Sepala 5, oblonga 3 mm. longa, 2 mm. lata, apice obtusa, 3-nervia, extus hirsuta, pilis glandulosis globuliferis, utrinque glanduloso-flavo-punctata. Petala 5, variabilis in magnitudine, oblonga, brevissime unguiculata, $2\frac{1}{2}$ mm. longa, $1\frac{1}{2}$ mm. lata, apice obtusa, basi acuta ad unguem brevem abeuntia. Stamina 5? Capsula subglobosa, carpellis 5, demum distinctis. Semina oblique globoso-oblonga $\frac{1}{2}$ mm. longa, testa tenui, minute et breve echinato-muricata.

HAB. Mt. Morrison, ad 9000 ped. alt., leg. S. SASAKI., Oct. 1909.

Near *S. Linnæi*; but differs by the very much thinner testa of the seeds and in other points.

Cerastium LINN.

Cerastium subpilosum HAYATA sp. nov. *C. pilosum* HAYATA Fl. Mont. Formos. p. 58, (non LEDEB.). Gracillima; caulis 30-40 cm. altus, tenuiter pilosus, pilis patentibus. Folia opposita, sessilia linearis-oblanceolata, $3\frac{1}{2}$ -4 cm. longa, 4 mm. lata, apice acuta, basi attenuata, supra parce aristato-pilosa, subtus glabra, pallida, margine remote ciliolata, costis supra tenuissime sulcatis subtus elevatis, venulis inconspicuis. Flores laxissime cymosi, pedicellis gracilis 1-2 cm. longis viscoso-pilosis. Sepala 5, ovato-oblonga, 2-3 mm. longa, apice obtusa, dorso et margine parce ciliata, integra, $1\frac{1}{4}$ mm. lata. Petala 5, linearis-spathulata, $3\frac{1}{2}$ mm. longa, $\frac{1}{2}$ - $\frac{1}{3}$ mm. lata, apice rotundata, basi attenuata. Stamina 5. Ovarium ovoideum $1\frac{1}{2}$ mm. longum, stylis 4-5. Capsula cylindrico-

globosa $3\frac{1}{2}$ mm. longa, 2 mm. lata, apice truncata, basi obtusa, ore 8-10-dentata, dentibus obtusis erectis. Semina oblongo-globosa leviter complanata, 1 mm. longa, rubescentia, minute tuberculata.

HAB. Monte Morrison, 1908, leg. T. KAWAKAMI.

Near *C. pilosum*, but differs from it by the smaller less hairy leaves and in many other points. I fail to compare this to any other species of this genus.

Stellaria LINN.

Stellaria arisanensis HAYATA n. n.

Cerastium arisanensis HAYATA Mater. Fl. Formos. p. 35, et Ic. Pl. Formos. p. 69, t. 13.

As is clearly seen from the construction of the fruits, the plant should be properly referred to *Stellaria*.

Stellaria arisanensis HAYATA var. ***leptophylla*** HAYATA n. v. Folia majora, longe petiolata, ovato-rhomboidea, $2\frac{1}{2}$ cm. longa 17 mm. lata, apice acuta, ad summum breve aristata, basi subrotundata, ad extremitatem subito acuta et attenuata ad petiolum $1\frac{1}{2}$ cm. longum abeuntia. Flores similes cum typica.

HAB. Rontabunsan, leg. U. MORI.

Distinguishable from the type only by the much larger shape of the leaves. It may prove to be a summer form of the type when the habit is fully known.

Guttiferæ.

Garcinia LINN.

Garcinia multiflora CHAMP. (Tab. IV.) MATSUM. et HAYATA Enum. Pl. Formos. p. 43; HAYATA Ic. Pl. Formos. I. p. 83. Frutex 2–3 m. alta, basi ramosissima, dense foliata. Ramuli recti glabri longitudinaliter sulcato-rugosi, glabri, viridescentes, divaricatae ramosi. Folia opposita, obovata vel obovato-cuneata, apice obtusa, basi cuneata, usque ad 8 cm. longa, $3\frac{1}{2}$ cm. lata, æquilateralia vel ± obliqua, chartacea, vel chartaceo-coriacea, utraque glabra, in exsiccato subviridia concolora, supra glabra, sub microscopio minute lepidota, lepidibus minutissimis rotundatis, costis supra planis subtus elevatis, venis primariis supra obscure subtus distinete elevatis utroque latere costæ 10–11 subrectis vel ~formiter curvatis angulo 30°–40° a costa divaricatis prope marginem per nervum marginalem contextis, petiolis angustissime subalatis $1\frac{1}{2}$ cm. longis supra planis tenuissime sulcatis subtus convexis. Flores dioecii; corymbi ♂ terminales subpaniculati 5 cm. longi 3–4 cm. lati dichotome ramosi, (rhachidibus ad ramificationem peltato-annulariter tumidis utroque latere stipuliferis, stipulis minutissimis cuspidiformibus), pedicellis 7 mm. longis basi bracteis 1 instructis, bracteis triangularibus deciduis cuspidiformibus $\frac{1}{3}$ mm. longis. Sepala 4 valde concava, imbricata, chartacea, rotundata, 2-exteriora majora 8 mm. longa, 2-interiora ± minora 7 mm. longa rotundata basi contracta paralleliter multinervia, nervis circ. 10. Petala 4, obovato-cuneata, 11 mm. longa, 9 mm. lata, apice latissima rotundata, infra apicem usque ad basi recto-cuneata, basi 1 mm. lata, alba, divaricato-multinervia, subreticulata. Stamina 4, filamentis validiusculis rectis 4 mm. longis apice rotundato dilatatis antheriferis, antheris ♂ sessilibus 2-locularibus. Rudimentum ovarii columnare, subcomplanatum, apice peltato-dilatatum, botrioideo-tuberculatum.

HAB. Kusukusu prope Botansha, leg. B. HAYATA et S. SASAKI, Juni. 11, 1912.

This very rare and handsome tree was for the first time in June last year collected by Mr. S. SASAKI and myself, in my last journey to the island. It was found on a crag by the mountain pass from Kusukusu to Botansha, which was quite an unbeaten track for any one except for savages. The flowers have a so close resemblance in its external feature to those of *Euonymus* that I was led to mistake the plant for one of the Celastrus-family. It was first recorded from the island by Dr. A. HENRY. So far as I can judge from the description given in BENTH. Fl. Hongk. p. 25, the present plant may be identical with this species.

Ternstroemiacæ.

Anneslea WALL.

Anneslea fragrans WALL. var. **lanceolata** HAYATA n. v. (Tab. V.)
 Arborescens. Rami et ramuli validi cinerascentes rugosi glabri. Folia lanceolata, oblongo-lanceolata vel interdum obovato-lanceolata, 10–12 cm. longa, 3 cm. lata, apice subito acuta ad summum obtusa, basi acuta ad extremitatem attenuata ad petiolum abeuntia, utraque pagine glabra, supra nitida subtus pallida opaca sub lente parce punctata, costis supra impressis subtus elevatis, venis utraque pagine inconspicuis non visis, margine desuper recurvata integerrima, coriacea, in exsiccato fusco-flavescentia, petiolis 2–3 cm. longis teretibus supra non sulcatis sursum ± obscure subalatis basi ad insertionem leviter obscure peltato-dilatatis. Flores versus apicem ramulorum brevissime racemose dispositi vel quasi-axillares, ad axillam folii solitarii, longe pedicellati, cernui vel penduli, pedicellis circ. 3 cm. longis petiolum in longitudine superantibus desuper recurvis glabris plus minus complanatis vel alatis apice latioribus cum alis 4 mm. latis apice sub flore 2-bracteatis, bracteis oppositis ovatis 5–6 mm. longis 4–5 mm. latis apice truncatis vel emarginatis ad centrum mucronatis basi vix contractis crassis dorso-carinato-alatis (carinis $\frac{1}{2}$ mm. latis apice ad mucronem attingentibus), margine

eroso-denticulatis ad apicem dentium \pm glanduloso-crassatis. Sepala 5, valde imbricata, semi-patentia, ovata vel rotundata, 1–1½ cm. longa, sursum margine introrse valde recurva, apice acuta basi rotundata contracta ad insertionem 3 mm. lata, utraque page glabra, crassiuscula, versus marginem tenuiora ad marginem tenuissima hyalina margine integra vel ciliata. Petala 5, 14–17 mm. longa basi alte in tubum 6 mm. longum connata, partibus liberis obovatis 10 mm. longis medio 6 mm. latis apice acuto-triangularibus basi cuneatis contractis 2–3 mm. latis ad basin utroque latere 1-auriculatis, auriculis obtusis vel obsoletis, partibus connatis vel tubis 6 mm. longis, partibus liberis tenuissimis, partibus connatis minus tenuibus multinerviis, nervis parallelis ad basin partis liberae convergentibus sursum et deorsum divergentibus ad utraque extremitatem petalorum \pm convergentibus, utraque page glabra. Stamina ∞ circ. 40, 1– (vel 2?) seriatim disposita, glabra petalis paullo breviora, 13 mm. longa inclusa, filamentis 5 mm. longis complanatis crassiusculis $\frac{3}{5}$ mm. latis, antheris adnatis basifixis linearibus 4–5 mm. longis 1½ mm. latis introrse dehiscentibus basi cordatis apice acutis connectivis apice in appendiculam longe productis, appendiculis linearibus apice acuminatis 3–4 mm. longis anthera paullo brevioribus. Ovarium semi-inferius vel semisuperius, late conicum 4 mm. latum, supra calycem brevissime exsertum, apice ad stylum abeuns, triloculare, loculis 3-ovulatis, ovulis e sumnum loculorum pendulis, stylo filiformi 1½ cm. longo apice brevissime 3-lobato, lobis circ. 1 mm. longis apice acutis intus sulcatis.

HAB. Hiiransan, prope Kusukusu, leg. B. HAYATA et S. SASAKI, 1912, Juli.

Very like the type, but differs from it in having narrower leaves and two larger bracts immediately below the calyx. Through the courtesy of Mr. E. D. Merrill of the Philippines, I was able to find a proper genus to which this plant should be referred. Very remarkable for its petals united to the middle.

Adinandra JACK.

Adinandra hainanensis HAYATA sp. nov. Rami fuscentes. Folia obovato-oblonga, coriacea, 10 cm. longa, 4½ cm. lata, apice breve cuspidato-acuta, ad summum obtusa, basi acuminata, (costis supra tenuiter impressis, subtus

elevatis, venis et venuulis utraque pagine elevatis reticulatis), margine minute serrulata, petiolis 1 cm. longis intus subplanis extus rotundatis. Flores axillares solitarii pedicellati, pedicellis 1½ cm. longis recurvis, bracteis 2–3 instructis. Sepala fructifera 5 valde imbricata ovata apice acuminata, extus sericeo-pubescentia, intus glabra, 7–8 mm. longa, 6 mm. lata. Fructus subglobosi, apice extus sericeo-pubescentes apice rostrati, rostris 2 mm. longis cum stylo articulatis, stylis persistentibus adpresso sericeo-pubescentibus.

HAB. Hainan, leg. N. KONISHI, Juni. 1909, (No. 5).

Near *Adinandra lasiostyla* HAYATA, but differs from it by the serrulate leaves.

Adinandra hypochlora HAYATA sp. nov. Rami fuscentes. Folia obovato-oblonga, tenuiter coriacea, maxima 9 cm. longa 3½ cm. lata, apice breve acuminata, vel acuta, basi ± attenuata vel acuminata, in exsiccatu supra fuscentia subtus flavescens, costis supra impressis subtus elevatis, venis et venuulis supra elevatis subtus tenuissime elevatis distinctis interdum inconspicuis, margine supra medium serrulata vel vix serrulata, deorsum integra, petiolis 5–6 mm. longis intus late sulcatis. Flores ignoti. Baccæ axillares, solitariæ, (pedicellis 2 cm. longis apice ± incrassatis), globosæ 1 cm. in diametro, adpresso pubescentes apice apiculatæ. Sepala fructifera oblonga, glabra persistentia 8 mm. longa, 4 mm. lata, apice obtusa, dorso medio costata, coriacea, margine tenuia, remote serrulata vel subintegra.

HAB. Tōkō, leg. Y. KIKUCHI, Aug. 1912.

Near *Adinandra lasiostyla* HAYATA, but differs from it in having quite glabrous sepals.

Thea LINN.

Thea gnaphalocarpa HAYATA sp. nov. Frutex, rami graciles, cortice fuscenti longitudinaliter fisso demum soluto, ramulis sursum pilosis. Folia obovato-oblonga, coriacea, breve petiolata maxima, 4½ cm. longa, 2 cm. lata, apice obtusa vel breve acuta, basi cuneata vel acuta, margine serrulata (ad summum serrularum apiculata), margine ± desuper recurva, utraque glabra, supra nitida, subtus pallida, costis venis et venuulis utraque pagine elevatis,

interdum inconspicuis, petiolis 4 mm. longis tenuissime hirsutis intus late sulcatis. Flores axillares vel pseudo-terminales, solitarii vel gemini, sessiles, alabastro oblongo 8 mm. longo apice acuto. Sepala 5–10, decidua, extus hirsuta, inæqualia, (extimum minimum, intimum maximum) rotundata, maxima 8 mm. in diametro valde concava intus glabra. Petala 5, basi distincta, inæqualia exteriora latiora breviora rotundato-cuneata 12 mm. longa 10 mm. lata apice emarginata, interiora longiora angustiora 2 cm. longa 7 mm. lata apice 2-lobata, (lobis 3 mm. longis apice obtusis), basi angustata cuneata, basi utraque pagine glabra vel sursum extus ± hirsuta. Stamina numerosa circ. 1 cm. longa, exteriora usque ad medium connata, interiora pauca distincta tota glabra, filamentis apice liberis tenuibus, antheris rotundato-reniformibus 1 mm. latis. Ovarium dense sericeo-pilosum globosum 2 mm. longum, stylis 3 usque ad infra apicem connatis 3 mm. longis.

HAB. Karapin, leg. S. SASAKI, 1910, Dec.

Very near *T. Sasanqua* Miq., but differs from it in having much smaller flowers and smaller leaves. It may prove to be a variety of the latter, when the habit is fully known. Here is another spicemen from Fokien resembling very much this plant, and it may probably be the same species.

Thea parvifolia HAYATA sp. nov. (Tab. VI.) Frutex? ramosi, ramis gracilibus, cortice cinerascenti longitudinaliter soluto, ramulis apice patentopilosus. Folia coriacea rhomboideo-oblonga rhomboideo-lanceolata vel ± ovata, 3 cm. longa 11 mm. lata, apice acuminata ad summum obtusa, basi cuneata, margine ascendentō-serrulata versus basin integra, utraque pagine glabra, costis supra hirsutis subtus glabris, petiolis 4 mm. longis intus late sulcatis, venis et venulis non conspicuis. Flores ad apicem ramulorum pseudo-terminales solitarii brevissime racemosi 2 cm. in diametro, pedicellis 4 mm. longis vel 0 multi-bracteatis pubescentibus, bracteis inberioribus late triangularibus superioribus majoribus. Sepala 5–6, late rotundata, interiora majora 3 mm. lata 2 mm. longa extus pubescentia intus glabra margine ciliata. Petala 5 basi in tubo 3 mm. longo connata, valde inæqualia, rotundata vel oblonga, 10–12 mm. longa, altra crassiuscula extus hirsuta intus glabra, altra tenuia utraque pagine glabra apice rotundata. Stamina

numerosa, 1 cm. longa, intima 5 libera, exteriora alte connata, tubum formantia, tubo cum petalis adnato, filamentis parte libera incrassatis versus apicem tenuissime filiformibus, antheris triangularibus, loculis basi sagittato-divergentibus. Ovarium globosum apice ad stylum abeuns sericeo-tomentosum, stylo filiformi 13 mm. longo sericeo-pubescenti apice 3-fido, ramis 1 mm. longis.

HAB. Mt. Randaisan, leg. U. MORI, Mart. 1908, (No. 3549).

Near *T. lutchuensis* Ito; but differs from it by the much smaller and acuminate leaves.

Dipterocarpeæ.

Ancistrocladus WALL.

Ancistrocladus hainanensis HAYATA sp. nov. Rami teretes, fuscentes, glabri, lèves, lenticellis linearibus notati, ramulis unciferis, uncis semi-circularibus validis. Folia variabilima alterna, chartacea vel chartaceo-coriacea, oblonga, oblongo-obovata, obovato-lanceolata, 40–6 cm. longa, 10–3 cm. lata, apice rotundata vel obtusa, basi attenuata spathulata sessilia, a basi 5–6 mm. lata, margine integra, utraque page sub lente minute albo-lepidoto-punctata, (lepidibus rotundatis margine lobulatis), et sub lente minute parceque impresso-punctata, costis supra impressis, subtus elevatis, venis utraque tenuiter elevatis, venuulis tenuissimis reticulatis, margine integra. Flores spicato-paniculati, paniculis terminalibus, floribus spicatim dispositis, paniculis 10 cm. longis 8 cm. latis, sub floribus singulis 1-bracteatis, bracteis minutis 2 mm. longis oblongo-triangularibus margine serrulatis. Sepala 5, basi connata, 6 mm. longa, intus lepidota, oblonga, imbricata, glabra. Petala 5, imbricata, oblonga, 4½ mm. longa, apice rotundata, glabra, intus lepidota. Stamina 10, ad basin petali affixa, 1½ mm. longa, antheris subcordatis apice emarginatis basi cordatis ¼ mm. longis, loculis divaricatis, filamentis basi ± dilatis. Ovarium inferius 1-loculare 1-ovulatum, ovulis amphitropis, stylo 3-fido, ramis 1½ mm. longis apice valde oblique dilatis. Calyx fructifer valde accrescens, tubus 5 mm. longus, lobis inæqualibus, majoribus obovato-spathulatis 4 cm. longis 2 cm. latis basi

3 mm. latis elevato-reticulato-venosis, minoribus $2\frac{1}{2}$ cm. longis. Fructus calycis tubo adnatus turbinatus vertice subplanus, calycis laciniis alæformibus cinctus. Semen subglobosum, albumen ruminatum.

HAB. Hainan, leg. Z. KATSUMADA, 1909.

Sterculiaceæ.

Sterculia LINN.

Sterculia luzonica WARB.; MERRILL Fl. Manila p. 327.

OBSERV. Folia alterna oblongo-cordata 11 cm. longa 7 cm. lata, apice subito acuminata ad summum obtusa, basi cordata chartacea vel tenuiter coriacea, margine integerrima, utraque pagine glabra, basi 5–7 nervia, venis lateralibus utroque latere 6 a costa angulo 50° egressis, petiolis 3 cm. longis teretibus. Folliculi gemini divaricati vel solitarii, breve stipitati, apice brevissime rostrati breve villoso-pubescentes rugulosi, oblique semi-globosi, 4–5 cm. longi 3 cm. lati, inflati, extus in exsiccato fusco-flavescentes, intus subrubescentes, valvis incrassatis lignosis. Semina in carpellis singulis 2, ellipsoidea 18 mm. longa 11 mm. lata, utrinque obtusa vel rotundata, tenuissime latere compressa, testæ exocarpium tenuiter chartaceum subnitidum nigricans ± obscure et tenuissime striatum, mesocarpium pulveraceum, endocarpium chartaceum nitidum nigricans.

HAB. Kōtōshō, leg. U. MORI et S. SASAKI, 1911, April.

This somewhat differs from the type in having acuminate leaves and much thinner broader carpels.

Determined by Mr. T. KAWAKAMI at Manila in his trip to the Archipelago.

Hiptage GÆRTN.

Hiptage leptophylla HAYATA sp. nov. Rami fusco-purpurascentes vel fuscantes, recti, graciles. Folia opposita membranacea, ovata vel ovato-oblonga, rarius obovata, maxima 8 cm. longa 4 cm. lata, apice abrupte acuta vel apiculato-acuta, basi late cuneata vel rotundato-acuta, costis venis et venulis utraque pagine tenuissime elevatis distinctis, supra glabra, subtus ad et prope costam adpresso hirsuta, petiolis 5 mm. longis adpresso hirsutis. Racemi axillares vel terminales, oppositi, plerumque ad axillas gemini, 5–6 cm. longi dense vel laxe florati, rhachidibus et pedicellis adpresso pubescentibus, bracteis subulato-lanceolatis 2–3 mm. longis, pedicellis 5–10 mm. longis. Sepala 5, inæqualia oblonga vel oblongo-rectangularia, apice rotundata, basi æquilata, circ. 4 mm. longa 2½ mm. lata, extus adpresso pubescentia intus glabra, sed basi hirsuta. Petala 5 rotundato-oblonga, 13 mm. longa 9 mm. lata, apice rotundata, basi brevissime unguiculata, (unguis angustissimis ⅓ mm. latis 2 mm. longis) extus adpresso hirsuta intus glabra margine fimbriata multinervata. Stamina 10, declinata, omnia fertilia, unum cetris multo majus. Stylus 1 filiformis primum circinnatus, stigmate capitellato rarius truncato.

HAB. Tandaisha, Jyōgesha, leg. U. MORI, Aprili. 1910.

Near *H. Madablotia* GÆRTN.; but differs from it in having much shorter racemes, smaller flowers and very much thinner and smaller leaves. It differs also from *H. obtusifolia* DC., by the ovate acute leaves.

Rutaceæ.

Xanthoxylum LINN.

Xanthoxylum ? pistaciiflorum HAYATA sp. nov. Rami recti, cortice rubro-fuscenti, lenticellis elevatis subpeltatis 2-lobatis notati. Folia alterna trifoliolata, in ambitu triangulari-rhomboidea, foliolo terminali maximo obovato-oblongo $6\frac{1}{2}$ cm. longo 27 mm. lato apice obtuso ad summum retuso basi attenuato ad petiolulum $\frac{1}{2}$ cm. longum abeundi tenuiter coriaceo basi integro supra basin usque ad apicem tenuissime breve crenato-serrato, serris brevisimis, costa supra impressa vel elevata subtus elevata, venis lateralibus tenuissime distincte elevatis rectis prope marginem furcatis, supra nitida, subtus non nitida, petiolulis subalatis, foliolis lateralibus minoribus dimidium terminalis æquantibus, petiolis communibus 2 cm. longis subteretibus intus sulcatis vel angustissime alatis. Flores ♂: paniculati, paniculæ axillares 3 cm. longæ laxe floratæ, pedicelli 2-3 mm. longi basi 1-bracteati, bracteis spathulato-linearibus $\frac{1}{2}$ mm. longis apice ciliato-fimbriatis. Sepala 5, spathulato-linearia, $1\frac{1}{2}$ mm. longa. $\frac{1}{2}$ mm. lata, apice obtusa, glabra. Petala 0. Stamina 5, sepalis opposita, sepalis longiora $1\frac{1}{2}$ mm. longa, antheris late cordatis introrsis apice obscure apiculatis. Rudimentum ovarii minutum globoso-pyramidalis.

HAB. Akō: Bongarisha, leg. G. NAKAHARA et SASAKI.

Somewhat resembles *Z. ovalifolium*, but greatly differs in the floral structure.

Xanthoxylum pteropodum HAYATA sp. nov. Rami subrecti, glabri, ut videntur enermes. Folia imparipinnata, in ambitu obovato-lanceolata, 24 cm. longa 8 cm. lata, 21-17 foliata, foliolo terminali longissime lanceolato 6-7 cm. longo $1\frac{1}{2}$ cm. lato apice acuminato basi cuneato-acuto chartaceo, (costa supra impressa subtus elevata), supra fuscenti subtus pallidissimo, (venis lateralibus supra non visis subtus tenuissime distinctis elevatis), margine tenuiter crenulato-serrato, ad sinus inter serras calloso-punctato, non petiolato, foliolis lateralibus superne majoribus inferne minoribus eo terminali

conformibus sed multo minoribus, iis basirabilis minimis oblongis apice obtusis basi acutis brevissime petiolulatis, petiolis communibus 15 cm. longis, angustissime alatis intus planis semiteretibus. Paniculæ ♀ terminales folio multo breviores 4–5 cm. longæ, bracteis minutis lanceolatis $\frac{1}{3}$ mm. longis. Carpella matura globosa, 3 mm. in diametro; semina nitida.

HAB. Arisan, leg. G. UYEMATSU, 1912.

Near *X. piperitum* DC., but differs from it in having winged common petiols and acuminate leaflets.

Fagara LINN.

Fagara laxifoliolata HAYATA. sp. nov. Scandens? Rami subrecti, brevissime remoti aculeati, aculeis 1–2 mm. longis desuper recurvis acutis, cortice fuscenti ruguloso superne minute parceque lenticellato. Folia alterna, in ambitu ovata 20–25 cm. longa 12 cm. lata, impari-pinnata laxe foliolata, pinnis 11–13, foliolo terminali maximo obovato-oblongo 8 cm. longo $3\frac{1}{2}$ cm. lato apice longe cuspidato ad summum obtuso basi subito attenuato ad petiolulum abeundi chartaceo chartaceo-coriaceo margine subintegro supra nitido, costa supra impressa subtus elevata, venis rectis utraque page tenuiter distinete elevatis), petiolulo circ. 2 cm. longo, foliolis lateralibus terminali minoribus breve petiolulatis, iis basilaribus 4 cm. longis basi ± obliquis, petiolulis $\frac{1}{2}$ cm. longis, petiolis communibus 15 cm. longis teretibus supra sulcatis gracilibus. Paniculæ ♀ axillares 5–7 cm. longæ. Fl. ♀: pedicellis 2–3 mm. longis tenuissime pubescentibus basi 1-bracteatis, bracteis triangularibus $\frac{2}{3}$ mm. longis obtusis. Calyx 4-partitus, sepalis triangularibus obtusis 1 mm. longis incrassatis, margine tenuissimis. Petala 4, imbricata, ovata, 3 mm. longa 2 mm. lata, apice obtusa, crassiuscula, margine tenuia sub lente minute denticulata. Rudimenta staminum 4. Carpella 4 cum stylo reflexo rostrata.

HAB. Shichiseitonzan, leg. Y. SHIMADA, Aprili. 1911.

Near *F. Avicennæ* DC., (BENTH. Fl. Hongk. p. 58); but differs from it in having flowers with four carpels and cuspidate leaflets.

Murraya LINN.

Murraya omphalocarpa HAYATA sp. nov. Frutex?; rami glabri, cinerascentes. Folia alterna pinnata 3–5-foliolata, foliolo terminali majore obovato 7 cm. longo 4 cm. lato apice cuspidato breve acuto ad sumnum obtuso vel retuso basi cuneato-acuto coriaceo, (costa supra late sulcata subtus elevata, venis utraque pageine tenuiter elevatis utroque latere 7–8 rectis apice furcato-ramosis), in exsiccato utraque pageine pallido margine subintegro vel remote vel obscure crenato, petiolulo brevissimo 3 mm. longo intus sulcato, foliolis lateralibus alternis terminali conformilis sed minoribus, petiolis communibus 5–6 cm. longis intus planis extus convexis. Flores pseudo-umbellati, umbellis quasi-terminalibus sessilibus 5–6-radiatis, radiis 1–1½ cm. longis, floribus 1½ cm. longis. Calyx basi campanulatus alte 5-partitus, sepalis oblongo-linearibus 2½ mm. longis 1½ mm. latis apice crassiusculis tenuiter pubescentibus. Petala 5, oblongo-lanceolata 23 mm. longa 8 mm. lata, apice obtusa vel acutiuscula, basi attenuata, basi 1 mm. lata margine deorsum integra sursum crenulato-repanda. Stamina 10, altra longiora 14 mm. longa, altra 11 mm. longa, filamentis complanatis, antheris reniformibus utrinque emarginatis. Discus incrassatus pulviniformis. Ovarium oblongo-cylindricum circ. 3 mm. longum 1 mm. latum, subglabrum vel basi tenuissime hirsutum, basi ad stipitem brevem attenuatum, apice ad stylum abeuns, stylo 1 cm. longo glabro, stigmate subpeltato integro vel obscure 2-lobato. Bacca ovoidea 2 cm. longa, 1–1½ cm. lata, rubra, longe rostrata, basi contracta ad stipitem brevem 1–2 mm. longum abeuns, 2-locularis, loculis 1-spermis, pericarpio rubro glandulosso-punctato crasso. Semina oblonga, tenuiter complanata, 12 mm. longa, dense fibroso-barbata, barbis 7 mm. longis, testa tenui, cotyledonibus oblongis, radicula minutissima.

HAB. Kōtōshō et Kwashōtō.

Near *M. exotica*, but differs from it by the larger rostrate fruits and petals with attenuate base.

Meliaceæ.

Chisocheton BLUME.

Chisocheton kusukusense HAYATA (Tab. VII.) Frutescens vel arborescens. Rami cortice fusco-rubescenti. Folia pinnata ampla 35 cm. longa vel longiora pari- vel impari-pinnata membranacea vel chartacea 7–8-foliolata in ambitu obovata, foliolis oblongis vel ovatis vel ovato-oblongis 8–15 cm. longis 5–3 cm. latis apice acutis ad summum obtusis basi acutis vel obtusis vel rotundatis utrinque glabris, (costa supra plana subtus elevata, venis lateralibus supra planis inconspicuis subtus tenuiter distinete conspicuis, venis secundariis non visis), breve petiolulatis. Paniculae axillares erectæ laxe floratæ foliis breviores, pedicellis 1– $\frac{1}{2}$ cm. longis hirsutis multi-bracteatis, bracteis triangularibus 1 mm. longis acutis hirsutis, pedicellis infra calyceum articulatis. Calyx campanulatus hirsutus 4-dentatus, dentibus latissimis brevissimis. Petala 4, erecto-patentia extus hirsuta intus glabra valvata, angusta 8 mm. longa 2–2 $\frac{1}{2}$ mm. lata, basi sensim angustiora, apice obtusa incrassata, margine tenuia, basi æquilata. Tubus staminalis 6 $\frac{1}{2}$ mm. longus 3 $\frac{1}{2}$ mm. in diametro, apice margine integer, glaber, prope apicem interiore antheras sessiles gerens, antheris 8 oblongo-linearibus. Discus tubuliformis ovarium amplectans apice hirsutus. Ovarium conicum 1 mm. longum apice ad stylum abeuns, stylo recto cum tubo staminali æquilongo, stigmate late peltato, pelta rotundata 1 mm. in diametro.

Euonymus acutorhombifolia HAYATA sp. nov. Ramuli ultimi tetragoni, ad angulos angustissime alati, subpallidi. Folia opposita rhomboideo-oblonga, apice breve acuminata basi subito recto-cuneata, ad extremitatem attenuata, $8\frac{1}{2}$ cm. longa, 4 cm. lata, chartaceo-coriacea, supra nitida, in exsiccato

supra pallida subtus pallidissima, costis et venis utraque pagee distinete elevatis ~formiter recurvis, venis primariis lateralibus utroque latere 4, a medio sursum serrata deorsum subintegra ad marginem leviter recurva subsessilia vel petiolis brevissimis 1–2 mm. longis. Flores 1–2 subfasciculati vel breve pauceque racemosi, bracteis lanceolato-triangularibus crassiusculis margine rubro-ciliolatis, pedicellis 1–1½ cm. longis. Sepala 4, late rotundata, denticulato-ciliolata. Petala 4 late rotundata, margine denticulato-ciliolata. Stamina 4, antheris late reniformibus 1½ mm. latis ¾ mm. longis subsessilibus ad apicem dentium disci siti, filamentis brevissimis vel 0. Discus concavus, rectangulari-formis remote obscure 4-dentatus, dentibus remotis latissimis. Ovarium vix elevatum vel subplanum, stylo brevissimo.

HAB. Montibus maritimis Formosæ, ad 4000 ped. alt., leg. Y. FURUKAWA, Mart. 1910.

Euonymus pallidifolia HAYATA sp. nov. Ramuli recti albo-flavescentes vel pallidissimi, teretes, nec rugosi nec lenticellati, cortice albo-flavescenti, foliati. Folia in exsiccato albo-flavescentia, pallidissima, concolora, opposita, oblonga, rotundato-oblonga coriacea, apice acuta vel obtusa sed ad extremitatem semper obtusa vel leviter retusa, basi rotundata acuta rotundato-obtusa, supra utraque pagee glabra, costis supra acuto-elevatis subtus minus elevatis vel obtuso-elevatis, venis lateralibus primariis supra tenuissime elevatis subtus non visis vel minus elevatis utroque latere 5–6 rectis angulo 50°–60° a costa egressis, margine integerrima angustissime arcte desuper recurva marginata, petiolis brevissimis 5 mm. longis 1½-plo laminam æquantibus. Flores non visi. Pedunculi fructiferi axillares solitarii 3½ cm. longi erecti. Capsula depresso-globosa, 1½ cm. in diametro 7 mm. longa, rubro-flavescens, 3-valvatim dehisces, valvis lignoso-coriaceis, 3-locularis, loculis 1-spermis. Semina quadratiformia 8 mm. longa inæqualiter 3–4 striata apice arillis rubris coronata.

HAB. Kōshun, leg. NISHIGAKI, Jan. 1910.

Euonymus pellucidifolia HAYATA sp. nov. (Tab. X.) Frutex 3–4 m. alta recta, ramis et ramulis subviridescentibus subgracilibus rectis longitudinaliter sulcatis non lenticellatis glabris. Folia opposita, glaberrima,

oblonga, oblongo-lanceolata vel lanceolata, apice acuminato-cuspidata, basi cuneato-attenuata, 10–13 cm. longa 4 cm.– $2\frac{1}{2}$ cm. lata, chartaceo-membranacea vel chartacea, pellucida, supra nitida in exsiccato pallida, concolora, (costis utraque pagee elevatis distinctis, venis lateralibus primariis supra tenuiter distincte elevatis subtus non distinctis vix visis utroque latere 4–5 remotis, — formiter recurvis), margine remote serrulata, (serrulis subobtusis) deorsum integra, petiolis $\frac{1}{6}$ – $\frac{1}{12}$ -plo laminam aequantibus 10–7 mm. longis intus profunde sulcatis extus transversim rugosis. Cymæ axillares solitariae vel 3–4-fasciculatae ad ramulos brevissimos sitæ 2–3 cm. longæ paucissime dichotome floriferæ, ad ramificationem bracteatæ, bracteis minutis deciduis, pedicellis 7–8 mm. longis medio articulatis. Flores patentes 7 mm. in diametro. Sepala 5 late orbicularia patentia in magnitudine inæqualia, minoribus $1\frac{1}{2}$ mm. latis majoribus $2\frac{1}{2}$ mm. latis, margine rubro-ciliolata. Petala 5, inæqualia late rotundata, (majoribus 3 mm. longis $3\frac{1}{2}$ mm. latis), rubescens marginè minute denticulata, basi contracta $\frac{1}{2}$ –1 mm. lata. Stamina 5 ad discum sita, filamentis brevissimis vix 0, antheris reniformibus $\frac{3}{4}$ mm. latis $\frac{1}{2}$ mm. longis, loculis divaricatis ad apicem connectivorum oblique vel transversim sitis albis, connectivis incrassatis minute rubro-punctatis. Discus subplanus rotundatus, $2\frac{1}{2}$ mm. in diametro, leviter 5-lobatus. Ovarium in disco subimmersum late conicum 5-loculare, loculis 1-ovulatis, ovulis erectis, stylo brevissimo.

HAB. Suisha, ad 2000 ped. alt., leg. B. HAYATA et S. SASAKI Mai. 27, 1912.

Euonymus Dielsiana HAYATA (non Læsner) in Mater. Fl. Formos. p. 58.

The present plant is certainly near *E. Dielsiana* Læs. from which it is distinguishable in having 5-merous flowers. It is collected by Mr. S. SASAKI and myself in my last excursion to the island in a forest by Suisha-lake on an altitude of nearly 2000 ft. The tree is very well known among savages, on account of its superior quality for making a kind of bow.

Celastrus LINN.

Celastrus oblongifolia HAYATA sp. nov. Scandens ramis teretibus longitudinaliter rugulosis lenticellatis, lenticellis rotundatis, glabris.

Folia chartacea, ovato-oblonga vel ovato-elliptica apice acuminata, basi rotundato-obtusa vel rotundata, 10 cm. longa 4 cm. lata, margine remote mucronato-serrulata, (mucronibus a se 4 mm. remotis), nigricantia, costis supra tenuiter elevatis subtus valde elevatis, venis supra tenuiter subtus distincte elevatis, venis lateralibus primariis utroque latere 6, costis subtus breve hirsutis vel subglabratris, venis arcuatis, petiolis 12 mm. longis $\frac{1}{6}$ -plo laminam æquantibus. Flores non visi. Capsula paniculata, (pedicellis 1 cm. longis) 3-valvatim dehisces, ovata, apice apiculata, valvis lignoso-coriaceis. Semina subquadrantiformia interiore recurvata, arillus rubris.

HAB. Arisan, Jan. 1912, leg. B. HAYATA et S. SASAKI.

Near *C. articulatus*, but differs from it in having much longer narrower leaves.

Gymnosporia W. et A.

Gymnosporia trilocularis HAYATA sp. nov. Rami subrecti teretes, cortice cinerascenti longitudinaliter sulcato-ruguloso. Folia ad ramos brevissimos laterales ternatim sita, obovata vel obovato-cuneata, 5 cm. longa 33 mm. lata, coriacea, apice rotundata, basi cuneata, in exsiccato remote crenata, ad sinus crenarum nigro-mucronato-punctata, costis supra distincte costatis, subtus elevatis, venis lateralibus supra tenuissime subtus distincte elevatis grosse reticulatis, petiolis 4 mm. longis circ. $\frac{1}{6}$ -plo laminam æquantibus supra utroque latere subalatis sulcati. Cymæ ad apicem ramorum brevissimorum lateralium fasciculatæ. Flores non visi. Cymæ fructiferæ 3 cm. longæ, pedicellis 1 cm. longis. Capsula trilocularis, valvis late rotundatis 5 mm. longis apice mucronatis. Semina oblonga, 3 mm. longa, 2 mm. lata, testa nitida fusco-rubescens, basi arillata.

HAB. Kötōshō : litore occidentali, leg. K. MIYAKE, Nov. 1899.

Celastrus trilocularis HAYATA in Herb. Mus. Taihoku.

The present plant is near *G. diversifolium* MAXIM., from which this is distinguishable by the larger leaves and trilocular capsules.

Cassine LINN.

Cassine illiciifolia HAYATA sp. nov. (Tab. XI.) Frutex? Rami et ramuli subgraciles, longitudinaliter rugulosi, lenticellati, ramulis ultimis (cortice subfusco-rubescenti) glabris longitudinaliter subalatis sulcato-rugulosis cicatricibus foliorum semi-oblongis notatis. Folia opposita ovata obovato-lanceolata, apice acuta acuminata, ad summum obtusa, basi cuneata, acuminata, gradatim ad petiolum abeuntia, circ. 7 cm. longa 2½–3 cm. lata chartacea vel tenuiter coriacea vel membranaceo-coriacea, in exsiccato supra pallida, nitida, subtus albo-pallidissima, costis supra distincte graciliter elevatis subtus planis non distinctis, venis lateralibus primariis tenuissimis distinctis utroque latere 7–8 subrectis angulo 40°–50° a costa egressis subtus non distinctis, margine integerrima, petiolis $\frac{1}{10}$ –plo laminam æquantibus subalatis subplicatis 7 mm. longis glabris. Flores breve cymosi vel solitarii, cymis axillaribus dichotome ramosis paucifloratis, pedicellis 3 mm. longis apice 2-bracteatis, bracteis rotundato-triangularibus 1 mm. longis subacutis margine rubro-denticulatis. Calyx obconicus, lobis 4 decussatim imbricatis late rotundatis 1 mm. longis 2 mm. latis, margine fimbriato-albo- vel -rubro-ciliatis page glabris. Petala 4 calycis lobis alterna, ad faucem calycis affixa ovato-oblonga 2 mm. longa 1½ mm. lata crassiuscula apice obtusa denticulata exteriore reflexa, basi contracta $\frac{1}{2}$ mm. lata, latere margine integra, intus convexa extus concava. Stamina 4, ad faucem calycis affixa, filamentis validiusculis rectis, antheris reniformibus versatilibus introrsum dehiscentibus. Discus subcampanulatus calycis tubo adnatus, apice 4-lobatus, lobis liberis cum stamine alternis late liguliformibus $\frac{2}{3}$ mm. latis $\frac{1}{3}$ mm. longis. Rudimentum ovarii (vel ovarium?) subconicum brevissimum 2-loculare, loculis 1-ovulatis, stylo breve columnari cum ovariis 1½ mm. longo tenuiter 4-sulcato. Capsula obovoideo-cylindrica 13 mm. longa 5 mm. lata, pericarpio coriaceo, 1-sperma. Semina obovoidea 12 mm. longa, testa rubra.

*Otherodendron illiciifolium** HAYATA in Sched. (Herb. Taihoku Museum.)

* The genus *Otherodendron* MAKINO, to which the present plant with the following two species was provisionally referred, is separated from *Cassine* LINN. in having a dehiscent capsule. The fruit of the former has very similar structure as that of the latter which has sometimes 1 or 2 seeds within a hard coriaceous pericarp.

HAB. Arisan, ad 7500 ped. alt., leg. S. SASAKI, Mart. 1911. (Fl. ♂); Taito: Takukeisha, leg. U. MORI, Dec. 1906. (Fr. ♀).

The male flowers are very like those of *C. japonicus*, but differs from them by the much smaller form. Fruits are also much smaller than those of the Japanese species.

Cassine kotoensis HAYATA sp. nov. Frutex. Rami et ramuli recti, cortice longitudinaliter ruguloso, ramulis longitudinaliter sulcato-rugulosis rubescensibus. Folia opposita, obovata, rotundato-oblonga, rhomboideo-oblonga, apice acuta breve cuspidata ad summum obtusa, basi cuneato-acuta ad extremitatem subito attenuata ad petiolum abeuntia, chartacea vel tenuiter coriacea, pallida vel viridescentia, costis utraque pagine elevatis distinctis, venis lateralibus primariis utroque latere 5–6 rectis vel ~formiter curvatis utraque pagine tenuissime elevatis, venuis supra interdum inconspicuo-reticulatis, margine integerrima, petiolis 8 mm. longis interiore plicato-sulcatis laminam $\frac{1}{10}$ -plo æquantibus. Flores cymosi, cymis axillaribus solitariis dichotome ramosis, pedunculis 1 cm. longis. Flores maturi non visi.

Elæodendron japonicum HAYATA, (non FR. et SAV.) in MATSUM. et HAYATA Enun. Pl. Formos. p. 84; *Otherodendron kotoense* HAYATA in Sched. (Herb. Mus. Taihoku.)

HAB. Kōtōshō, leg. K. MIYAKE, Nov. 1899.

Cassine micrantha HAYATA sp. nov. Ramuli graciles, recti, divaricati, cortice fusco-rubescenti, glabri longitudinaliter rugosi. Folia rhomboideo-oblonga vel obovato- vel ovato-oblonga, apice cuspidato-acuta, basi late cuneata vel subito acuta ad extremitatem breve attenuata, 9–10 cm. longa 5–5½ cm. lata, membranaceo-chartacea vel chartacea, in exsiccato costis utraque pagine elevatis, venis lateralibus primariis utroque latere 7–8 rectis vel ~formiter recurvis supra tenuissime et distincte elevatis subtus minus distinctis, venuis supra minute reticulatis subtus minus distinctis, in exsiccato utraque pagine pallida, margine integra, petiolis $\frac{1}{2}$ cm. longis interiore sulcato-plicatis laminam $\frac{1}{10}$ -plo æquantibus. Flores cymosi, cymis axillaribus solitariis 5–6-floratis dichotome-floriferis, pedunculis 4 mm. longis, pedicellis

1-2 mm. longis apice 2-bracteis instructis, bracteis triangularibus 1½ mm. longis acutis dorso acuto-angulatis margine rubro-ciliatis; flores sub calyce cum pedicellis articulati. Flores maturi non visi.

HAB. Byōritsu: Shinsuiye, leg. T. KAWAKAMI, Oct. 1908, (No. 7192).

Rhamneæ.

Rhamnus LINN.

Rhamnus acuminatifolia HAYATA sp. nov. Rami, cortice cinerascenti longitudinaliter lenticellato et rimis longitudinalibus fisso. Folia alterna oblongo-lanceolata vel obovato-lanceolata, maxima 13 cm. longa 4½ cm. lata, tenuiter chartacea, apice acuminata vel cuspidato-acuminata basi cuneato-obtusa vel acuta, margine minute serrulata prope basin integra, supra ad costam sulcata, subtus costis elevatis, venis lateralibus primariis supra tenuissime impressis vel non impressis subtus distinete elevatis rectis prope marginem subito arcuato-ascendentibus eam superiorem proximam attingentibus 30°-40° a costa divaricatis, venuis transversis tenuissimis, utraque page glabra, petiolis laminam ¼-plo æquantibus 12 mm. longis hirsutis intus sulcatis teretibus. Flores umbellati, umbellis pedunculatis, pedunculis pedicello brevioribus solitariis axillaribus hirsutis. Calyx hirsutus, lobis triangularibus acutis. Flores apertientes non visi.

HAB. Nantō: Rokujyōdaisan, leg. U. MORI, 1908, Aug. Fr. (No. 1156); Ritozan, leg. T. KAWAKAMI, Juli. 1913.

Differs from *R. crenata* S. et Z. by the much more acuminate and narrower leaves.

Rhamnus japonica MAXIM. var. **decipiens** MAXIM.

HAB. Fōkien: Usekisan, Oct. 1910, leg. S. NAGASAWA.

Compared with a specimen of this variety in the Tōkyō Herbarium.

Rhamnus nepalensis LOUR. Cult.

Rhamnus Sieboldiana MAKINO in Tōkyō Bot. Mag. XXVI, p. 392.

HAB. Fokien : Seizengi (cult.?), leg. S. NAGASAWA, Aug. 1910.

Compared with a specimen of this species in the Tôkyô Herbarium.

Ampelidæ.

Cissus LINN.

Cissus pteroclada HAYATA (Tab. XII.) Ic. Pl. Formos. II. p. 107.

Descriptio auctata : Calyx late campanulatus, $1\frac{1}{2}$ mm. longus, $2\frac{1}{2}$ mm. latus, apice truncatus. Petala conduplicato-valvata, elongato-triangularia $2\frac{1}{2}$ mm. longa, basi $1\frac{1}{2}$ mm. lata, basi tenuia, apice crassiuscula cuculliformia, erecta. Stamina 4 cum petalis opposita 2 mm. longa, filamentis $1\frac{1}{2}$ mm. longis, antheris ovoideis $\frac{1}{2}$ mm. longis, connectivis incrassatis. Ovarium subconicum apice acutum ad stylum brevem abeuns, stylo brevissimo 1 mm. longo, stigmate oblique terminali.

Vitis LINN.

Vitis leucocarpa HAYATA sp. nov. Caulis subteres glaber, longitudinaliter minute multi-sulcatus. Folia pedatim 5-foliolata, foliolo terminali petiolulato lanceolato apice acuminato basi obtuso vel acuto, petiolulis lateralibus angulo recto divaricatis apice furcatim ramosis foliolos laterales gerentibus, foliolis lateralibus oblique oblongis acutis minoribus omnibus serratis, (serris apiculatis), prope basin subintegris, petiolis communibus lamina folioli terminalis æquilongis gracilibus. Fructus baccati albicantes depresso globosi, 6-7 mm. in diametro. Semina 5, quadrantiformia, testa dura dorso transverse rugosa.

HAB. Suisha, Mai. 1912, leg. S. SASAKI et B. HAYATA.

This is very near *V. japonica* and *V. corniculata*; but differs from them by the much smaller leaves and white fruits.

Vitis umbellata HEMSL. var. ***arisanensis*** HAYATA n. v. Caulis gracilis teres glaber vel hirsutus, ramis et ramulis valde divaricatis. Folia digitatim 5-foliolata in ambitu cordata, foliolo terminali magno sublanceolato vel

ovato-lanceolato 3–5 cm. longo $1\frac{1}{2}$ cm. lato acuto vel acuminato basi acuminato-cuneato apice ad summum calloso-aristato membranaceo vel membranaceo chartaceo supra glabro viridissimo subtus glabro pallidiore, (costis supra acute elevatis subtus obtuse elevatis, venis lateralibus utroque latere 4–5 supra non elevatis subtus tenuiter impressis et distinctis), margine utroque latere dentibus ascendentibus 5–6 (dentibus apice obtusis aristatis callosis), foliolis lateralibus obliquis minoribus, eis basilaribus minimis sessilibus, petiolis communibus gracilibus glabris vel tenuiter hirsutis foliolo terminali æquilongis vel longioribus, stipulis majusculis latis oblique oblongo-triangularibus 3 mm. longis apice obtusis scariosis margine minute ciliolato-denticulatis cum eis oppositis caulem amplectantibus, cirrhis oppositifoliis multiramosis. Fructus umbellati, umbellis pedunculatis, pedunculis 3 cm. longis, a medio deorsum 6–4-bracteis instructis, bracteis oppositis stipula conformibus, pedicellis (radiis) $1\frac{1}{2}$ cm. longis. Fructus baccati, globosi 1–2-spermi. Semina rotundata plano-convexa 4–5 mm. in diametro, facie et dorso vermiculata rugulosa.

HAB. Mt. Arisan, leg. B. HAYATA et S. SASAKI, Jan. 1912.

Differs from the type by the much smaller and narrower leaves.

Sapindaceæ.

Kœlreuteria LAXM.

Kœlreuteria formosana HAYATA (Tab. XIII.) Folia bipinnata obovata, 40–50 cm. longa, 30 cm. lata, pinnis 9–11; pinnis infimis minimis a basi petioli 8 cm. distantibus 5-foliolatis, foliolo terminali ovato-acuminato 6 cm. longo 3 cm. lato basi obtuso apice cuspidato-acuminato supra nitido subtus pallidiore margine subintegro vel pauci-serrato, costis supra tenuiter elevatis subtus prominentibus, venis lateralibus tenuibus subtus elevatis prominentibus, foliolis lateralibus lanceolatis terminali minoribus angustioribus basi obliquis, petiolulis 2 mm. longis; pinnis mediis majoribus 20 cm. longis 13 cm latis 9–11 foliolatis, foliolo terminali majore, lateralibus obliquis acuminatis pauciserratis; petiolis communibus cum rhachidibus 40 cm. longis,

lenticellis rotundatis notatis glabris longitudinaliter rugosis basi incrassatis. Capsula vesicularis, inflata, 3-lobata, loculicide 3-valvata, valvis membranaceis reticulato-nervosis rotundatis 4½ cm. longis 4 cm. latis margine tenuiter marginatis, septis seminiferis. Semina subglobosa nigra exarillata, testa crustacea nigra; embryo spiraliter convolutus.

HAB. Tappansha, leg. U. MORI, Oct. 1906, (No. 1736).

Near *Kalreuteria bipinnata* FRANCH., but differs from it in having subentire leaflets.

Acer LINN.

Acer (*Integritolia*) cinnamomifolium HAYATA sp. nov. (Tab. XIV.-A.)
 Rami recti, cortice fusco-rubescenti, longitudinaliter rugosi, lenticellis parvis tenuiter elevatis medio 1-sulcatis, ramulis hornotinis basi dense mollissime tomentosis perulis multiseriatis instructis, perulis scariosis extimis minoribus triangularibus 2 mm. longis obtusis convexis, intimis longissimis 1 cm. longis sublinearibus molle tomentosis. Folia ad apicem ramulorum oppositim sita, lamina ampla membranacea vel membranaceo-chartacea, elliptica vel oblonga vel ovato-elliptica 11–12 cm. longa 4½–5 cm. lata, apice breve cuspidata ad summum obtusa basi obtusissima vel subrotundata, margine integra vel grosse obscure undulata, supra glaberrima vel ad costas tomentosa, subtus tenuissime dense mollissimeque tomentosa, albicotia, supra in exsiccato fulvescentia, costis et venis rubescensibus utraque pagine tenuissime elevatis, venuis secundariis supra minute tenuissime elevato-reticulatis, distincte trinervia, nervis lateralibus latere inferiore plus ramosis, nervo centrali pauci-ramoso utroque latere venulas 2–3 emittenti, petiolis gracilibus ¼-plo laminam æquantibus supra sulcatis subteretibus basi tomentosis. Cymæ ad ramulos terminales, 6 cm. longæ totiusque latæ, rhachidibus pedicellisque dense albo-tomentosis, pedicellis gracilibus 3 cm. longis erectis. Sepala 4–5 linearia, 2–4 mm. longa, ¾ mm. lata, apice obtusa, extus hirsuta, intus glabra, patentia. Petala 4–5, linearia vel linearispathulata, apice obtusa, basi angustata, 3–4 mm. longa, 1 mm. lata, utraque pagine glabra. Discus extrastaminalis, 8–10-partitus, segmentis latis subglobosis ¾ mm. latis. Stamina 8–10, filamentis 1½ mm.

longis glabris, antheris oblongis 1 mm. longis emarginatis vel apiculatis. Ovarium dense hirsutum late obtriangulare 2 mm. latum $1\frac{1}{2}$ mm. longum, stylo prope basin 2-fido, ramis patentio-recurvatis $1\frac{1}{2}$ –2 mm. longis.

HAB. Fokien : Kosan, leg. S. NAGASAWA.

Very interesting species, remarkable for its trinerved leaves which are covered by very thin soft tomentum. It is certainly a species referable to the section *Integrifolia* PAX.

Acer (Integrifolia) hypoleucum HAYATA sp. nov. (Tab. XIV.-C.)
 Rami subrecti, longitudinaliter leviter rugulosi, lenticellis longitudinaliter notati, lenticellis medio sulcatis, cortice fuscenti, ramulis ultimis molle tomentoso-pubescentibus. Folia opposita oblonga vel elliptica apice obtusissima interdum ad summum retusa vel non retusa, basi rotundata vel obtusa, circ. 8 cm. longa $3\frac{1}{2}$ –4 cm. lata, chartaceo-coriacea, margine integra vel leviter undulata, supra glabra, in exsiccato fulvo-rubescens, subtus glaucessima alblicantia leviter albo-purpurascens tenuissime molle tomentosa, costis supra tenuiter elevatis vel non elevatis rubescentibus subtus prominente elevatis, venis lateralibus primariis utroque latere 5 subrectis vel medio sursum subreflexis angulo 50° – 60° a costa egressis, petiolis subgracilibus 2 cm. longis laminam $\frac{1}{4}$ -plo in longitudine æquantibus supra tenuiter sulcatis basi leviter incrassatis. Flores non visi. Cymæ fructiferæ ad ramos laterales terminales, 5 cm. longæ 7 cm. latæ, rhachidibus et pedicellis pubescentibus, pedicellis gracilibus $1\frac{1}{2}$ cm. longis. Carpelli loculi valde prominentes facie grosse reticulato-striati glabri superne (apice) impressi; alæ cum loculis 17 mm. longæ 6 mm. latæ angulo 80° a se divaricatae.

HAB. Baatankei, leg. U. MORT, Juli. 1912.

Near *A. nevium* BLUME, *A. oblongum* WALL. and *A. lanceolatum* MOLLJARD; but differs from the first by the quite obtuse leaves which are whitish on the underside, from the second by the quite obtuse oblong leaves thinly covered by very soft wools and from the last by the oblong elliptic leaves.

Acer (Integrifolia) litseæfolium HAYATA sp. nov. (Tab. XIV.-B.)
 Rami et ramuli glabri, cortice fuscenti lenticellis minutis notato. Folia

oblanceolata, chartacea, vel chartaceo-coriacea, 10 cm. longa 23 mm. lata, apice acuminata ad summum obtusissima, basi acuta vel cuneata, supra glabra, subtus glauca, costis et venis supra planis subtus prominentibus, venis primariis lateralibus utroque latere 8–10, venulis subtus transverse reticulatis, petiolis $\frac{1}{4}$ -plo laminam in longitudine æquantibus circ. $2\frac{1}{2}$ cm. longis intus sulcatis basi incrassatis. Cymæ fructiferæ ad ramos terminales, 4 cm. longæ 5 cm. latæ, rhachidibus et pedicellis glabris, pedicellis 1 cm. longis vel longioribus. Carpelli alæ semi-oblongæ angulo 70° a se divaricatæ, cum loculis 2 cm. longæ, loculis subglabris.

HAB. Montibus prope Nantō, leg. Z. ŌHASHI.

Somewhat like *A. oblongum* WALL., but differs in its oblanceolate leaves.

Acer (*Indivisa*) **taiton-montanum** HAYATA sp. nov. Rami graciles, subrecti, toto glabri non lenticellati, sublæves, fusco-rubescentes. Folia triangulari-cordata, membranacea vel membranaceo-chartacea, 6 cm. longa 5 cm. lata, apice triangulari-acuminata, basi profunde cordata, elobata vel subtrilobata, margine duplicato-serrulata, glaberrima, trinervia, nervis et venis tenuissimis et distinctis subplanis vel leviter elevatis, nervis lateralibus angulo 50° a eo centrali divaricatis, venis lateralibus nervi centralis utroque latere 7–8, 7 mm. a se remotis rectis angulo 40° a costa divaricatis, petiolis 2 cm. longis $\frac{1}{3}$ -plo laminam in longitudine æquantibus intus late sulcatis basi haud incrassatis. Racemi fructiferi subterminales subpenduli; carpelli alæ oblongæ cum loculis 27 mm. longæ 7–8 mm. latæ apice obtusæ angulo 100° a se divaricatæ; loculi nervati.

HAB. In monte Taiton, leg. U. FAURIE, Mai. 1903.

This differs from *A. insulare* in having cordately based leaves, from *A. laxiflorum* in the shorter caudate leaves, from *A. crataegifolium* in the thinner cordate leaves, and finally from *A. Kawakamii* and *A. morrisonense* by the longer winged carpels.

Euscaphis SIEB. et ZUCC.

Euscaphis Konishii HAYATA sp. nov. Rami teretes, cortice glabro cinereo-fusco-marmorato longitudinaliter fisso. Folia opposita impari-pinnata

in ambitu ovata cum foliolis 10 cm. longa 6–7 cm. lata, foliolis sæpe 5 obovatis 4 cm. longis $2\frac{1}{2}$ cm. latis chartaceis apice cuspidato-acutis basi cuneato-acutis margine crenulatis ad apicem crenarum apiculatis, (costis utraque pagee elevatis venis lateralibus tenuissime elevatis), in exsiccato supra fuscentibus subtus pallidis vel pallidissimis. Flores ignoti. Carpella 4, divaricata, stipitata, ovata, apice late breveque rostrata, cum stipitibus 1 cm. longa 5 mm. lata. Semina compresso-subglobosa in arillis inclusa, 6 mm. longa 5 mm. lata.

HAB. Hainan, leg. N. KONISHI, 1909.

Differs from *E. japonica* by the shortly stalked carpels and by the crenulate leaves. It is named after the lamented N. KONISHI, in commemoration of his great botanical services. The plant was collected by him in the summer of the year 1909 in the island of Hainan, where he was taken with a fatal fever. After coming back to Taihoku, he died much to the sorrow of the present writer and to a great loss to the botanical world.

Sabiaceæ.

Meliosma BLUME.

Meliosma callicarpæfolia HAYATA sp. nov. Rami et ramuli graciles longitudinaliter rugosi, hornotini dense rubro-ferrugineo-pubescentes. Folia alterna chartacea vel membranaceo-chartacea, oblanceolata, obovato-lanceolata, 10–15 cm. longa, 3–4 cm. lata; apice acuminata vel caudato-acuminata, basi cuneata, cuneato-attenuata, margine subintegra vel repanda, utraque pagee glabra, supra ad costas elevatas hirsuta, subtus ad axillas venarum hirsuta, costis infra elevatis, venis lateralibus supra tenuiter subtus prominente elevatis, venis secundariis supra tenuiter subtus prominente reticulatis, basi gradatim attenuata ad petiolum abeuntia, petiolis 2–3 cm. longis gracilibus supra superiore alatis hirsutis basi incrassatis, partibus incrassatis 4 mm. longis. Paniculae terminales 10–13 cm. longæ 7–8 cm. latæ graciles ramosæ, ramis ramulisque gracillimis dense fusco-pubescentibus, floribus spicatim gerentibus, pedicellis ultimis $\frac{1}{2}$ mm. longis basi bractea una instructis, bracteis

ovatis acuminatis $\frac{1}{2}$ mm. longis ciliolatis, ciliis setulosis. Alabastrum floris minutum; sepala 4 late orbiculata 1 mm. lata $\frac{2}{3}$ mm. longa. Flores apertientes non visi.

Lespedeza MICHIX.

Lespedeza pseudomacrocarpa HAYATA sp. nov. (Tab. XV.) Frutex glaber, ramosus. Folia pinnatim trifoliolata, pinnis oblongo-obovatis apice rotundato-retusis brevissime mucronatis in exsiccato supra fuscis subtus pallido-glaucis reticulato-venosis, pinna terminali $3\frac{1}{2}$ cm. longa $1\frac{1}{2}$ cm. lata, petiolulo 1 cm. longo, lateralibus terminali conformibus sed minoribus $2\frac{1}{2}$ cm. longis, petiolulis 2 mm. longis, petiolis 2 cm. longis, stipulis subulatis scariosis 4 mm. longis, stipellis obsoletis vel minutis. Flores racemoso-paniculati. Calyces campanulati 5 mm. longi pubescentes, 5-fidi, lobis 2-superioribus connatis, 2-inferioribus linearibus vel subulatis 3 mm. longis. Vexillum obovatum 12 mm. longum 7 mm. latum, apice obtusum basi gradatim angustum. Alæ lineares 12 mm. longæ, (unguis tenuibus linearibus 3 mm. longis), supra unguem leviter auriculatæ, laminis 9 mm.

longis 4 mm. latis apice obtusis. Carina angustata incurvata rostrata unguiculata, unguibus 3 mm. longis, laminis circ. 10 mm. longis 2 mm. latis. Ovarium cylindraceum complanatum 3 mm. longum apice angustatum ad stylum abeuns, 2-ovulatum, pubescens, stylo 10 mm. longo supra medium incrassato. Legumina complanata, membranacea, reticulato-venosa, uni-sperma.

HAB. Toroku : Tonpozan, leg. T. KAWAKAMI (No. 1289).

Lespedeza macrocarpa HAYATA Mater. Fl. Formos. p. 79, (non BUNGE),

Very near *L. macrocarpa* BUNGE, but quite distinguishable from it by the much longer lobes of the calyx and in having always obovato-oblong emarginate leaves.

Mucuna ADANS.

Mucuna acuminata GRAH.?

HAB. Kōtōshō.

Owing to the imperfectness of the specimens, the determination is very doubtful.

Mucuna hainanensis HAYATA sp. nov. Rami superiore volubiles, ramulis teretibus glabris multo-sulcatis apice cirriferis. Folia 3-foliolata, foliolu terminali obovato-oblongo chartaceo $6\frac{1}{2}$ cm. longo $3\frac{1}{2}$ cm. lato apice breve cuspidato ad summum obtuso ad centrum apicis mucronato, mucronibus 1 mm. longis, utraque pagine subglabro vel tenuissime paucissime hirsuto, costis supra impressis subtus tenuiter elevatis, venis lateralibus utroque latere 4-5 tenuissimis, vel subtrinervio margine subintegro basi obtuso, petiolulo 3 mm. longo, stipellis linearis-filiformibus 3 mm. longis, foliolis lateralibus obliquis basi \pm rotundatis vel subcordatis, rhachidibus 13 mm. longis, petiolis communibus 3 cm. longis subteretibus basi \pm incrassatis, stipulis linearis-lanceolatis 3 mm. longis. Racemi axillares folio \pm longiores solitarii 10 cm. longi laxi-florati, bracteis magnis alabastrum floris amplectantibus oblongis 2 cm. longis pubescentibus, pedicellis 1 cm. longis sericeo-pubescentibus. Calyx sericeo-hirsutus pilis circ. 3 mm. longis fulvis dense obtectus, late globoso-campanulatus, alte 5-lobatus, 2-posterioribus conniventibus,

lobo antico longissimo cuspidato-triangulari 13 mm. longo 7 mm. lato apice acuto intus hirsuto, lateralibus antico minoribus 9 mm. longis 4 mm. latis. Vexillum brevius, carinas dimidium æquans, orbiculare $2\frac{1}{2}$ cm. longum totiusque latum apice rotundatum vel plicato-emarginatum basi breve auriculatum, auriculis truncatis, ungue brevissimo 3 mm. longo 2 mm. lato; alæ oblique oblongo-lanceolatae 5 cm. longæ 1 cm. latæ basi latere superiore auriculatae, unguibus 5 mm. longis; carinæ cum alis æquilongæ prope apicem recurvæ apice breve rostratae aculeato-acutæ linear-lanceolatae 6 mm. latæ, latere basi superiore auriculatae, unguibus 7 mm. longis. Stamina diadelpha, cum carinis æquilonga, filamentis prope apicem subito superne flexis clavato-incrassatis, antheris hirsutis. Ovarium sessile, dense hirsutum lineare 6 mm. longum, stylo filiformi 4 cm. longo apice ± incrassato, partibus incrassatis 1 cm. longis glabris.

HAB. Hainan, leg. Z. KATSUMADA, 1911.

Remarkable for the small size of the leaves.

Mucuna membranacea HAYATA sp. nov. Ramuli validiuseculi scandentes glabri striati teretes. Folia 3-foliolata, foliolo terminali ovato-rhomboideo, membranaceo 9 cm. longo 6 cm. lato apice obtuso breve cuspidato basi cuneato-acuto utraque pageine hirsuto 3-nervio, nervis et venis lateralibus supra tenuiter subtus prominente elevatis, petiolulis 6 mm. longis hirsutis, stipellis et stipulis linear-setosis 3 mm. longis, foliolis lateralibus eo terminali æquilongis valde obliquis latere superiore $2-2\frac{1}{2}$ cm. latis basi acutis, latere inferiore 4- $4\frac{1}{2}$ cm. latis basi latissime truncatis, petiolis communibus foliolo æquilongis, rhachidibus (inter petiolulum terminalem et petiolum) 2 cm. longis subglabris. Racemi axillares solitarii, bracteis non visis. Calyx late campanulatus, (tubo 1 cm. longo 2 cm. lato), villosopubescens longe ferrugineo-pilosus 5-dentatus, dentibus posterioribus con-natis brevissimis, antico longissimo cuspidato lanceolato basi 3 mm. lato 12 mm. longo, lateralibus ± brevioribus 8 mm. longis basi 4 mm. latis acutis. Vexillum late triangulo-cordatum 3 cm. latum 28 mm. longum apice obtusum subretusum basi auriculatum, auriculis $\frac{1}{2}$ cm. longis 4 mm. latis truncatis, ungue 4 mm. longo 3-4 mm. lato dorso gibboso-inflato; alæ elongato-

oblongo-lanceolatae $4\frac{1}{2}$ cm. longæ 14 mm. latæ obliquæ apice obtusæ, laminis basi latere superiore auriculatis, unguibus $\frac{1}{2}$ cm. longis margine dense ciliatis; carinæ cum alis æquilongæ a basi usque ad supra medium rectæ, supra medium prope apicem subito superne reflexæ apice acutæ ad summum rostratae \pm reflexæ subcartilagineæ lineari-lanceolatae supra medium latissimæ 7 mm. latæ, laminis basi latere superiore auriculatis, unguibus 1 cm. longis linearibus margine superiore ciliolatis. Stamina diadelpha, antheris dimorphis, filamentis versus apicem claviformibus ad summum longe apiculatis, ad apicem apiculorum antheras gerentibus. Ovarium lineare pilosum, stylo filiformi.

HAB. Kōtōshō, leg. S. KUSANO, (Fl.); leg. G. NAKAHARA, Feb. 1906.

Mucuna subferruginea HAYATA sp. nov. Scandens, rami subteretes, cortice subcinerascenti rugoso, lenticellis elevatis notati. Folia 3-foliolata, foliolo terminali oblongo-ovato apice obtuso ad summum apiculato (apiculis 3–4 mm. longis vel deciduis) basi obtuso 10 cm. longo $6\frac{1}{2}$ cm. lato, subtrinervio vel pinniveno, in exsiccato supra subglabro nigricanti subtus fulvo-fuscato tomentoso, ad costam et venas dense fulvo-hirsuto, margine integro, chartaceo vel chartaceo-membranaceo, petiolulo 8 mm. longo, foliolis lateralibus eo terminali æquilongis, latere superiore $2\frac{1}{2}$ cm. latis, latere inferiore $4\frac{1}{2}$ cm. latis, basi late truncatis, petiolis communibus 7–8 cm. longis gracilibus dense fulvo-tomentosis, stipulis triangulari-lanceolatis 6 mm. longis 2 mm. latis acutis extus dense pilosis intus glabris. Racemi ad ramos defoliatos lateraliter siti penduli, rhachidibus gracilibus 20 cm. longis dense brevissime fusco-tomentosis, floribus 6–7 cm. longis. Calyx late campanulatus basi superne sub-gibbosus, tubo $1\frac{1}{2}$ cm. longo 2 cm. lato, ore 5-dentato, dentibus posterioribus connatis brevissimis, antico cuspidiformi 1 cm. longo basi 7 mm. lato, lateralibus triangularibus brevioribus 5 mm. longis basi 6 mm. latis, extus sericeo-villosis simul longe fulvo-pilosus, intus sericeo-pubescentibus. Vexillum orbiculare 4 cm. latum totiusque longum apice obtuso-rotundatum, basi auriculato-cordatum breve unguiculatum, unguibus 3 mm. longis; alæ semiobovatæ, 6 cm. longæ 23 mm. latæ, apice rotundatae, basin versus angustatae basi latere superiore auriculatae, (auriculis $\frac{1}{2}$ cm. longis apice obtusis) latere margine inferiore curvatæ latere superiore margine rectæ, extus basin \pm hirsutæ, unguibus

6–7 mm. longis 3 mm. latis basi recurvis; carinæ alam in longitudine ± superantes, recurvato-ob lanceolatae, 7 cm. longæ 13 mm. latæ, apice breve rostratae ad summum cartilagineæ, supra medium usque ad basin rectæ, latere inferiore brevissime minutissime auriculatae, unguibus 6 mm. longis linearibus. Stamina diadelpha cum carinis æquilonga. Ovarium lineare complanatum 2 cm. longum 1½ mm. latum, apice gradatim in stylum abeuns, parce hirsutum, stylo filiformi basi hirsuto apice glabro.

Caulis erectus 1–2 m. altus, cortice rubro-fulvescenti, maximus 10 cm. in diametro, mediocris 5 cm. in diametro, basi eramosus supra medium ramosus, ramulis superioribus scandentibus sinistrorso-volubilibus, cortice ramulorum in exsiccatu rubro-fusco-nigrificanti. Folia alterna impari-pinnata, 15–13-foliolata, foliolis oblongo-ob lanceolatis 4.5–5 cm. latis quam latis 3-plo longioribus; novella pallido-fulvescentia sericeo-pubescentia, apice acuminata, margine integra, estipellata. Flores racemosi,

racemis axillaribus 2-4-fasciculatis pedicellis 1 cm. longis floribus 2-3-fasciculatis, bracteis obsoletis, petalis ad marginem purpurascens. Calyx breve cylindricus, apice subtruncatus, 5-dentatus, dentibus posterioribus subobsoletis, 3-anterioribus conspicuis, medio plus conspicuo. Vexillum obovoideum apice emarginatum; alæ leviter longiores medio cum carinis tenuiter connientes; carinæ apice liberæ, basi distinctæ. Stamen vexillo oppositum liberum, cætra connata. Stylus filiformis postice recurvus, antice deorsum ciliolatus; stigma terminale, punctiforme; ovarium sessile, ovulis 5. Fructus oblongi subcomplanati ± obliqui 4 cm. longi 3 cm. lati 23 mm. crassi 1-spermi exalati lignosi extus dense tuberculati, prope suturam sublæves et obscure costati, in maturo rarius ad suturam inferiorem dehiscentes, apice rotundati ad summum breve apiculati, basi obtusi vel breviter stipitiformes angustati medio sensim et obscure tenuissime vix vel haud constricti, pedicellis 1 cm. longis validis. Semina obreniformia 3 cm. longa $2\frac{1}{2}$ cm. lata; testa nitida nigricans, ad apicem medio et ad centrum profunde impressa; cotyledonibus amplis late oblongis 3 cm. latis 22 mm. longis basi profunde cordatis, sinibus 14 mm. longis; radicula obsoleta.

HAB. Sankakuyū, leg. K. NAGAI, 1902.

The present plant is one of those leguminous plants which afford a poisonous matter used for fishing by the aborigines in Formosa. It was first labelled by Prof. J. MATSUMURA as *Derris chinensis* BENTH. Soon after, the professor regarded the plant different from BENTHAM's species and named it *D. taiwaniana*. The same plant was studied by Dr. K. NAGAI who regarded it to be referable to *Lonchocarpus* or more probably to *Coubulandia*, but not to *Derris*. He then expressed this opinion in a number* of the Journal of the Tōkyō Chemical Society. In my opinion, the plant certainly does not belong to *Derris* on account of its wingless fruits; nor should it be referred to *Lonchocarpus*, for the plant has a sessile ovary, but has neither elongated pod nor broaded suture. It is also different from *Coubulandia* in having neither tornose nor rounded pods. A genus to which the present plant should probably be referred is, in my opinion, *Pongamia*, as is seen from the structure of the fruits. The descriptions of

* Journal of the Tōkyō Chemical Society XXIII—7, pp. 744-777 (Japanese).

the flowers above given are mainly based upon the account given by Dr. K. NAGAI in his paper above referred to.

Euchresta BENN.

Euchresta Horsfieldii BENN. var. **formosana** HAYATA n. v. (Tab. XVI.) = *Euchresta Horsfieldii* HAYATA Ic. Pl. Formos. I. p. 207, (non BENN.). Suffrutex 50–100 cm. alta, non ramosa vel pauciramosa, ramis sursum foliosis zigzag-forme flexuosis, sursum teretibus 3–4 mm. in diametro glabris, apice tenuissime fulvo-pubescentibus. Folia impari-pinnata, cum petiolis 20 cm. longa 14 cm. lata, in ambitu oblonga, foliolis 5–4 omnibus conformibus, foliolis lateralibus oppositis, chartaceo-membranaceis, oblongis vel oblongo lanceolatis, apice acuminatis, basi obtusis, 10 cm. longis 3 cm. latis, supra viridissimis subtus pallidioribus, margine integris, costis tenuissime impressis, subtus elevatis, venis et venulis non distinctis, petiolulis 2 mm. longis, petiolis communibus foliolo brevioribus teretibus supra late sulcatis vel subalatis glabris, jugis foliolorum 3–4 cm. a se remotis. Racemi terminales, circ. 15 cm. longi, pedunculis 3 cm. longis dense floratis, rhachidibus et floribus brevissime fulvo-pubescentibus, pedicellis 6–2 mm. longis, bracteis basi pedicelli lanceolatis minutis 2 mm. longis. Calyx longe campanulatus, 8 mm. longus apice 6–7 mm. latus, basi obtusus, basi superiore gibbosus, apice breve 5-dentatus, (dentibus latis obtusis), extus intusque brevissime pubescens. Petala 5, supra basin calycis sita; vexillum spathulatum 1½ cm. longum basi 2 mm. latum, apice 2-lobatum vel emarginatum, 5½ mm. latum, (lobis rotundatis), deorsum gradatim angustum, non unguiculatum subplicatum ± recurvum integrum basin extus intusque pubescens; alæ recurvæ cultriformes unguiculatae, laminis semioblongis latere superiore rectis latere inferiore curvis basi latere inferiore auriculatis 9 mm. longis 3 mm. latis, unguibus linearibus 6 mm. longis ¾ mm. latis glabris; carinæ recto-cultriformes 13 mm. longæ, laminis semioblongis 8 mm. longis 4 mm. latis apice obtusis latere inferiore curvis latere superiore subrectis basi auriculatis, unguibus 5½ mm. longis ¾ mm. latis linearibus. Stamina diadelpha, eo vexillo opposito libero, cætris connatis, tubo filamentorum calycis basi connato, filamentis cum carina æquilongis basi extus pubescentibus, antheris versatilibus oblongis. Ovarium complanatum obovato-lineare,

5 mm. longum apice rostratum erecto-recurvum, (stigmata punctiformia), basi longe stipitatum, stipite 7 mm. longo glabro recto. Fructus ovoidei 22 mm. longi nitidi nigricantes 1-spermi apice breve apiculati, stipitibus 1 cm. longis validiusculis.

HAB. Kusukusu, Arisan, Sinsuiye, leg. S. SASAKI et B. HAYATA (Aug. Fl., Feb. Fr.), 1912.

Differs from the type in having purplish white flowers with sessile (not unguiculate) standards, much smaller leaflets and larger fruits. The plant was formerly regarded by myself as the same as the type; but a more close examination in the fields has led me to think it better to regard it as a variety of the type.

Sophora LINN.

Sophora flavescens AIT. var. **stenophylla** HAYATA n. v. Caulis subcomplanatus vel teres prominente sulcatus, glaber. Folia alterna imparipinnata in ambitu lanceolata, 20–25 cm. longa 5–6 cm. lata, 25–29-foliolata, foliolis suboppositis vel ± alternis jugis a se 1½–2 cm. remotis, linearilanceolatis 37 mm. longis 6 mm. latis apice acuminatis mucronatis basi obtusis margine integris supra subglabris vel brevissime pubescentibus subtus villoso-adpresso-pubescentibus, costis supra impressis subtus elevatis, venis primariis lateralibus non conspicuis, supra in exsiccato fuscentibus subtus pallido-fulvescentibus, petiolulis 1½ mm. longis pubescentibus, rhachidibus teretibus sulcatis, petiolis communibus 2 cm. longis basi complanatis ± dilatatis. Racemi terminales erecti 18 cm. longi, pedunculis 2 cm. longis simplicibus vel rarius ramosis, pedicellis 6 mm. longis pubescentibus. Calyx oblique campanulatus 6–7 mm. longus basi latere superiore gibbosus ore oblique truncatus obscure 5-dentatus, 2-posterioribus latissimis, 3-anterioribus minoribus extus tenuiter pubescentibus. Petala 5 supra basin tubi calycis affixa. Vexillum spathulatum 1½ cm. longum 5–6 mm. latum apice emarginatum a medio deorsum angustato-unguiforme, unguibus 7 mm. longis 2½ mm. latis; alæ cultriformes (laminis semi-oblongis), 13 mm. longæ, unguibus basin subtibio recurvis; carinæ cum alis æquilongæ, laminis recurvato-oblongis 6 mm. longis basi latere superiore auriculatis, unguibus 6 mm. longis linearibus.

Stamina 10, supra basin distincta basi pubescentia. Ovarium stipitatum hirsutum, stylo ascendentí, stigmate punctiformi.

HAB. Chokansan, leg. U. MORI, Aprili. 1901.

Differs from the type by the much narrower leaves and smaller flowers.

Sophora tetragonocarpa HAYATA sp. nov. Rami complanato-subteretes, glabri flavescentes facie late obscureque sulcati. Folia in ambitu oblonga, alterna, 15–20 cm. longa cum foliolis 10 cm. lata, circ. 15-foliolata, foliolis suboppositis vel ± alternis, terminali lateralibus conformi lanceolato 6 cm. longo apice obtuso-mucronato (mucronibus brevissimis) basi obtuso chartaceo vel chartaceo-coriaceo margine integerimo in exsiccato supra fusco nigranti subtus pallido-fulvescenti supra glabro subtus pubescenti supra tenuissime impresso-reticalato, costa supra impressa subtus prominenti, venis primariis lateralibus utraque page non conspicuis, subtus venulis minute reticulatis visis, petiolulis brevissimis 2 mm. longis tenuiter pubescentibus, rhachidibus gracilibus teretibus supra anguste profundeque sulcatis, petiolis communibus foliolum $\frac{1}{3}$ plo in longitudine æquantibus $1\frac{1}{2}$ cm. longis supra tenuiter sulcatis basi ± incrassatis, jugis foliorum a se $1\frac{1}{2}$ cm. remotis. Racemi fructiferi 20 cm. longi. Legumina moniliformia, (monilibus 2–3–4), subcomplanato-tetragono-angulata, ad angulus obtusa subglabra apice longe rostrata, (rostris nunc longissimis nunc brevibus apice acutis) basi stipitata, stipitibus 8 mm. longis, monilibus nunc proximis nunc remotis ad nodos constrictis distinctis vel confluentibus 2-valvatim vel ad suturam inferiorem dehiscentibus, pedicellis 5–7 mm. longis. Semina lævia subobliquæ complanato-oblonga $4\frac{1}{2}$ mm. longa, facie minus convexa, dorso plus convexa.

HAB. In regionibus montanis, leg. U. MORI, Juli. 1909.

Near *G. flavescentia* AIT., but differs from it in having larger lanceolate leaves and dehiscing 4-angled moniliformed pods.

Bauhinia LINN.

Bauhinia erythropoda HAYATA sp. nov. Ramuli superiores rubro-ferrugineo-tomentosi. Folia cordata, circ. 6 cm. longa, $6\frac{1}{2}$ cm. lata, apice acute 2-loba, (sinibus inter lobos $2\frac{1}{2}$ cm. longis acutis, lobis apice obtusis latere

extiore recurvis latere interiore rectis), basi cordata supra glabra nitida subtus ad nervos ferrugineo-tomentosa 9-nervia, venulis supra elevato-reticulatis subtus planis, petiolis lamina æquilongis 5 cm. longis rubro-ferrugineo-tomentosis apice basique incrassatis, stipulis obovatis obtusis extus ferrugineo-rubro-tomentosis intus glabris. Racemi terminales circ. 10 cm. longi 15 cm. lati, pedicellis longissimis divaricatis 4–5 cm. longis, bracteis linearibus 5 mm. longis acuminatis extus tomentosis intus nigricantibus, rhachidibus et pedicellis tomentosis, pedicellis superiore bracteis minoribus 1–2 instructis. Calycis tubus cylindraceus 1 cm. longus ± obliquus 2 mm. latus, limbus 5-fidus, lobis lanceolatis 12 mm. longis 3½ mm. latis cum tubo extus tomentosis intus glabris 3-nerviis. Stamina matura 3, filamentis ad orem tubi calycis affixis 1½ cm. longis basi validiusculis apice tenuissimis basi dense hirsutis sursum glabris, antheris oblongo-linearibus 5½ mm. longis 2 mm. latis versatilibus. Ovarium stipitatum, stipite cum latere calycis tubi adnato. Petala 5 obovata 23 mm. longa 12 mm. lata apice ± emarginata basi subito unguiculata (unguis 5 mm. longis) margine crispata extus parce hirsuta intus glabra, unguibus utroque latere hirsutis. Ovarium complanatum obliquum dense fulvo-rubro-hirsutum, stylo flexuoso glabro, stigmate dilatato ± peltato.

HAB. Hainan, leg. Z. KATSUMADA, 1910.

Near *B. ferruginea* ROXB., but differs from it by the oblong unguiculate petals.

Bauhinia longiracemosa HAYATA sp. nov. Ramuli graciles flexuosi, tenuiter pubescentes fusco-nigricantes. Folia alterna cordata chartacea vel chartaceo-coriacea triangulari-cordata 8–9 cm. longa 7–7½ cm. lata apice late obtusa et tenuiter retusa, ad centrum mucronata, basi late et leviter cordata, margine subintegra, 7-nervia, supra tenuiter subtus distincte elevata, supra nitida subtus pallidiora, ad medium secundum costam subplicata, petiolis 2½–3 cm. longis apice basique incrassatis fusco-nigricantibus gracilibus, stipulis deciduis minutis oblongis obtusis. Racemi subterminales 20 cm. longi 3 cm. lati, pedunculis 6 cm. longis, pedicellis 1 cm. longis basi 1 bracteis instructis, bracteis cuspidatis 1½ mm. longis rhachidibus et pedicellis sericeo-pubescentibus. Hydrangea LINN.

Hydrangea anomala DON.=(*H. glabra* HAYATA) in SCHNEIDER Illust. Handb. Laubh. II. p. 943, (fide SCHNEIDER).

As I have never seen a specimen of *H. anomala* DON., I am not in a position to decide whether the two (*H. anomala* and *H. glabra*) are exactly identical or not. I am here merely following SCHNEIDER's opinion.

Hydrangea glabrifolia HAYATA sp. nov. Rami recti teretes, cortice cinerascenti, ramulis rectis divaricatis rubro-purpurascentibus. Folia coriacea lanceolata, 5– $5\frac{1}{2}$ cm. longa $1\frac{1}{2}$ –2 cm. lata, apice acuta, acuminata, basi cuneato-obtusa margine minute serrulata, (serrulis mucroniformibus $\frac{1}{2}$ mm. longis 3–4 mm. a se remotis), apice basique subintegra, (costis supra tenuiter impressis

subtus elevatis, venis supra planis subtus tenuiter elevatis), utraque pagine glabra, petiolis 6 mm. longis basi leviter dilatatis supra sulcatis. Cymæ terminales pseudo-umbellatae, radiis 3–4 exterioribus longioribus $1\frac{1}{2}$ cm. longis, interioribus brevioribus 1 cm. longis pseudo-umbellulatis, umbellulis 10–12-floratis. Flores steriles marginales paucissimi interdum ad nullum reducti, pedicellis longioribus 1 cm. longis; sepala 4, obovato-orbicularia, 9 mm. longa 8 mm. lata, margine integra, 3-nervia, venis lateralibus 4–5 paucissimis non reticulatis. Flores fertiles parvi, pedicellis brevioribus 2–3 mm. longis; calycis tubus 1 mm. longus obconico-campanulatus $1\frac{1}{2}$ mm. latus, limbo 5-dentato, dentibus remotis oblongo-triangularibus $\frac{1}{2}$ mm. longis $\frac{1}{4}$ mm. latis; petala 5, oblonga, 2 mm. longa, 1 mm. lata, apice obtuse breve cuspidata basi obtuse breveque cuneata, ad insertionem $\frac{1}{4}$ mm. lata; stamina circ. 10, $1\frac{1}{2}$ mm. longa, filamentis glabris crassiusculis teretibus 1 mm. longis, antheris oblongis utrinque emarginatis $\frac{2}{3}$ mm. longis. Carpella 3, styli 3 circ. 1 mm. longi crassiusculi.

HAB. Tandaisan, leg. U. MORI, Aprili. 1910.

Near *H. chinensis*, but differs from it by the quite glabrous leaves, narrower lobes of the calyx, and many other points.

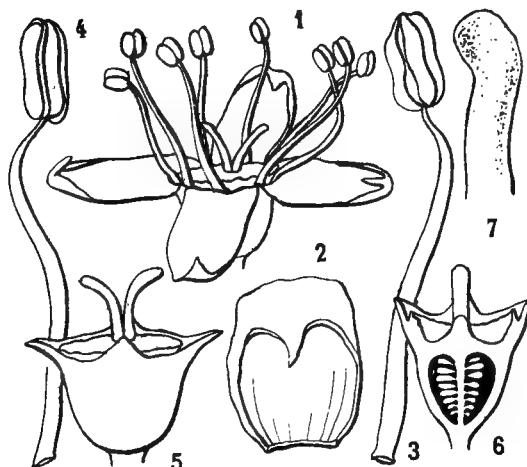

Fig. 17.

Hydrangea integrifolia HAYATA. 1, a flower; 2, a petal; 3, 4, stamens; 5, an ovary; 6, the same in vertical section; 7, apical portion of a style. All figures are magnified.

Hydrangea integrifolia

HAYATA (Fig. 17) Fl. Mont. Formos. p. 90, t. 7; Ic. Pl. Formos. II. p. 5. Descrip-tio auctata: Folia plantæ novellæ dentata, sed adulta integra. Alabastrum florum globosum 3 cm. in diametro perulis circ. 10 involucratum, perulis membranaceis semi-hyalinis rotundatis breve

denseque flavo-tomentosis (pilis stellatis adpressis) intus tenuiter extus dense pilosis oppositis, extimis minimis semiglobosis latis apice rotundatis 2 cm. latis 1 cm. longis basi subcordatis interioribus magnis rotundatis valde concavis alabastrum florum semi-amplectantibus $2\frac{1}{2}$ cm. longis explicato $3\frac{1}{2}$ cm. latis apice rotundatis vel leviter emarginatis, intimis 2 minoribus plus minus angustioribus. Inflorescentia expansa umbellatim cymosa 8-10 cm. lata 4-5 cm. longa, ramis tomentosis vel glabratiss. Fl. steriles: sepala 2 rotundata integra. HAB. Monte Randaisan, leg. U. MORI, Juni., 1911.

Rhododendron (*Choniastrum*) *leiopodum* HAYATA sp. nov. (Tab. XXIV.) Ramuli gracilisculi recti ternatim ramosi cinerascentes. Folia versus apicem ramulorum approximativis disposita coriacea elliptico-lanceolata vel ob-lanceolata usque ad 10 cm. longa 2½ cm. lata sursum medio latissima apice breve acuminata basi cuneata vel cuneato-acuta margine revoluta supra in exsiccato viridia subtus pallidiora, supra costis et venis impressis, venis venuulis impresso-reticulatis, subtus costis prominentibus venis lateralibus tenuissime elevatis vix conspicuis, utrinque glabra, petiolis 1½ cm. longis supra angustissime sulcatis apice angustissime alatis facie fuscentibus. Flores circa gemmam terminalem ad axillas foliorum quasi-verticillatorum summorum verticillatim siti, ad axillam folii singuli solitarii, floribus singulis perulis multis involucratis, perulis multis, extimis minimis late ovatis 3 mm. longis, interioribus majoribus, intimis longissimis spathulatis 3 cm. longis pedicellum 2-plo superantibus apice obtusis obtuso-rotundatis margine dense ciliolatis supra medio usque ad basin abrupte angustatis, partibus angustatis 18 mm. longis 3 mm. latis extus tenuiter pubescentibus intus glabris, bracteolis spathulatis angustissime linearibus 3 cm. longis sursum 3 mm. latis basi 1 mm. latis margine dense ciliatis extus tenuiter pubescentibus intus glabris, pedicellis 2 cm. longis vel brevioribus glabris. Calyx minor brevissimus 4 mm. in diametro 5-dentatus, dentibus late triangularibus obtusis 2 mm. latis ½ mm. longis glaberrimis. Corolla campanulato-hypocrateriformis usque

ad 6 cm. longa, tubo $2\frac{1}{2}$ cm. longo deorsum angustato intus supra basin usque ad infra medium tenuiter hirsuto, limbo 5-lobato, lobo superiore $3\frac{1}{2}$ cm. longo $2\frac{1}{2}$ cm. lato oblongo apice rotundato prope basin purpureo-punctato, lobis altris vix minoribus. Stamina 8, in longitudine inæqualia, filamentis complanatis prope basin tenuiter hirsutis basin glabris, a infra medium usque ad apicem glabris, antheris ellipsoideis 3 mm. longis $1\frac{1}{2}$ mm. latis apice truncatis lobatis 2-porosis basi emarginatis. Ovarium cylindricum 1 cm. longum $2\frac{1}{2}$ mm. latum glabrum leviter 5-sulcatum, stylo glabro 5 cm. longo apice vix dilatato, stigmate brevissime 5-lobato.

HAB. Shichiseitonsan, leg. S. SASAKI, 1911, Aprili. Fl.

The present plant is more or less related to *R. Henryi*, *R. Simiarum* and *R. ellipticum*, but differs from the first by the glabrous leaves, from the second by the glabrous peduncles and shortly acuminate glabrous leaves, and from the last in the pallid under surface of the leaves.

Rhododendron (*Choniastrum*) *leptosanthum* HAYATA sp. nov. *Rhododendron ellipticum* HAYATA Fl. Mont. Formos. p. 152, pro parte, (non MAXIM). Rami ± flexuosi cinerascentes. Folia versus apicem rami disposita ovato-vel obovato-oblonga 5–6 cm. longa $2\frac{1}{2}$ cm. lata utroque acuta apice acutissima basi acuta, (costa supra impressa subtus prominenti venis utraque facie tenuiter elevatis vix conspicuis) supra nitida subtus opaca pallidiora margine integerrima tenuissime recurva vel plana utraque glabra, petiolis brevioribus in longitudine $\frac{1}{4}$ -plo laminam æquantibus glabris supra angustissime sulcatis apice angustissime alatis. Flores quasi-terminaliter 5–6-fasciculati, (in sensu stricto circa gemmam ad axillas foliorum summorum quasiverticillatorum verticillatim 5–6 siti), perulis deciduis non visis, pedicellis glabris $1\frac{1}{2}$ cm. longis. Calyx brevissimus $2\frac{1}{2}$ mm. in diametro brevissime 5-dentatus, dentibus glabris brevissimis $\frac{1}{2}$ mm. longis obtusissimis. Corolla late campanulata 3 cm. longa, tubo brevi 1 cm. longo, limbo 5-lobato, lobis patentibus 2 cm. longis obovato-oblongis apice rotundatis intus supra basin usque ad infra medium tenuiter hirsutis. Stamina 10 in longitudine inæqualia, filamentis supra basin usque ad infra medium hirsutis basin glabris, infra medium usque ad apicem glabris, antheris ovato-oblongis 2 mm. longis apice truncatis basi

emarginatis non apiculatis. Ovarium cylindricum 5 mm. longum $1\frac{1}{2}$ mm. latum glaberum tenuiter 5-sulcatum, stylo $2\frac{1}{2}$ cm. longo glaberrimo apice vix dilato, stigmate brevissime 5-lobato.

HAB. In montibus prope Akō, ad 5000 ped. alt., leg. T. KAWAKAMI, 1907.

Differs from *R. leiopodium* by the much smaller flowers and ovato-oblong leaves; and from *R. ellipticum* in its pale lower surface of the leaves.

Rhododendron longiperulatum HAYATA sp. nov. Rami et ramuli ternatim ramosi divaricati pilis squamiformibus adpressis atro-castaneis dense obtecti. Folia chartacea oblonga 23 mm. longa 11 mm. lata in exsiccato flavescentia apice acuta ad summum apiculata supra scabro-pilosa (pilis albicantibus basi tumidis patentibus) infra parcissime pilosa, ad costas dense ad venulas parce adpresso-pilosa (pilis castaneis adpressis), supra costis venis et venulis impressis, venulis impresso-reticulatis, subtus costis et venis leviter elevatis venulis impressis reticulatis, venis primariis lateralibus utroque latere costæ 3–4 leviter arcuatis, petiolis brevissimis 2 mm. longis semiteretibus, pilis linearibus 3–4 mm. longis obtectis. Folia sub fasciculo florum variabilia spathulata basi dilata gradatim ad perulam abeuntia. Flores terminales 2–3-fasciculati, fasciculo in alabastro perulis imbricatis suffulto, perulis extimis minoribus ovatis brevioribus acutis, interioribus longioribus, intimis (vel bracteis sub flore) longissimis angustato-oblongis 18 mm. longis 5 mm. longis apice acutis, omnibus intus glabris extus dorso sursum ferrugineo-pilosis deorsum glabris. Flores 1-bracteati et 2-bracteolati, bracteolis linearibus 11 mm. longis $\frac{1}{10}$ vel $\frac{1}{20}$ mm. latis intus glabris extus pilosissimis, pedicellis 4–5 mm. longis longe pilosissimis. Calyx 5-lobatus, lobis triangulari-ovatis $2\frac{1}{2}$ mm. longis $1\frac{1}{2}$ mm. latis intus glabris extus longe denseque pilosis, pilis 3 mm. longis. Corolla campanulata 3 cm. longa 5-lobata, lobis oblongis 1 cm. longis apice rotundatis basi leviter contractis. Stamina 10 in longitudine inæqualia, filamentis complanatis deorsum hirsutis sursum glabris, antheris elongato-oblongis $1\frac{1}{2}$ mm. longis $\frac{3}{5}$ mm. latis apice truncatis 2-porosis basi leviter emarginatis non apiculatis, loculis anterioribus brevioribus quam iis posterioribus. Ovarium cylindrico-ovoideum $1\frac{1}{2}$ mm. longum pilis longissimis $2\frac{1}{2}$ mm. longis dense obtectum, stylo glaberrimo cum

ovario articulato 3 cm. longo, stigmate terminali \pm dilatato. Capsula breve cylindrica 7 mm. longa extus hirsuta.

HAB. Mt. Daiton, leg. Y. SHIMADA, Aug. 1910.

Rhododendron Morii HAYATA Mater. Fl. Formos. p. 173. Descriptio auctata: Folia in exsiccato supra venis et venuulis elevato-reticulatis, areolis intra reticulum impressis. Fores 5–6, terminale ad apicem ramorum fasciulati, pedicellis 2 cm. longis brevissime glanduloso-hirsutis. Calyx subplanus brevissimus 5 mm. in diametro breve 5-lobatus, lobis brevissimis late rotundatis margine glanduloso-ciliolatis (ciliolis brevissimis obtusis) utraque glabris. Corolla late campanulata a basi usque ad apicem gradatim ampliata 4½ cm. longa 5 cm. in diametro 5-lobata, lobis 2 cm. longis late rotundatis apice rotundatis vel tenuiter emarginatis, tubo intus latere superiore punctato-maculato, areolis punctatis obovatis 3 cm. longis 2½ cm. latis. Stamina 10, filamentis in longitudine inaequalibus basi \pm dilatis, partibus dilatis 8 mm. longis 1 mm. latis brevissime denseque hirsutis (pilis ferrugineis), partibus non dilatatis glabris, antheris ellipsoideis 3½ mm. longis apice truncatis basi lobato-emarginatis. Ovarium cylindricum 8 mm. longum 3½ mm. latum, pilis glandulosis brevissimis dense obtectum tenuiter 5-sulcatum, stylo 3½ cm. longo prope basin glanduloso-hirsuto cæterum glaberrimo apice dilatato, stigmate terminali.

HAB. Randaisan, 1908, leg. U. MORI, (No. 3514).

Rhododendron (*Azaleastrum*) ovatum PLANCH. ex MAXIM. Rhod. As. Or. p. 45; FORBES et HEMSL. Ind. Fl. Sin. II. p. 28.

Azalea ovata LINDL.; HOOK. Bot. Mag. t. 5064; BENTH. Fl. Hongk. p. 201.

OBSERV. Rami cinerascentes subglabri vel brevissime pubescentes, cicatricibus foliorum obtriangulari-rotundatis. Folia chartacea vel tenuiter coriacea versus apicem ramorum approximativam disposita ovata vel ovato-oblonga 4½ cm. longa 2 cm. lata apice cuneato-acuta ad summum obtusa ad centrum summorum mucronibus brevissimis instructa, basi rotundata vel obtusa utraque opaca et glabra subtus pallidiora, supra ad costas brevissime pubescentia, costis et venis supra elevatis elevato-reticulatis, subtus costis elevatis venis

non elevatis planis, venis lateralibus primariis inconspicuis, petiolis 7 mm. longis angustissime alatis supra angustissime sulcatis dense brevissimeque pubescentibus. Flores ad axillas foliorum superiorum solitarii perulis multiseriatis instructi, perulis extimis minutis triangularibus, intimis longissimis obovatis 1 cm. longis 8 mm. latis apice obtusis vel rotundatis basi deorsum angustatis ad insertionem $1\frac{1}{2}$ mm. latis margine revolutis minute ciliolatis (ciliolis minutissimis brevissimis obtusis) intus glabris extus brevissime pubescentibus, bracteolis filiformibus minimis 1 mm. longis, pedicellis $1\frac{1}{2}$ mm. longis brevissime pubescentibus pilis glandulosis parce hac atque illac dispersis. Calyx late campanulatus alte 5-lobatus extus basi pilis setulosis dense obtectus, lobis ovatis 5 mm. longis 4 mm. latis apice rotundatis membranaceis margine ciliolatis (ciliolis obtusis brevissimis \pm glandulosis) extus basi pilis setulosis dispersis, cæterum brevissime pubescentibus vel glabris, intus glaberrimis. Corolla late campanulata $2\frac{1}{2}$ cm. longa 4 cm. in diametro alte 5-lobata, (lobis rotundatis 2 cm. longis), prope basin lobi superioris purpureo-punctato-maculata, tubo intus brevissime pubescenti. Stamina 5 in longitudine inæqualia, filamentis medio deorsum hirsutis sursum glabris complanatis, antheris oblongis 3 mm. longis $1\frac{1}{2}$ mm. latis apice truncatis 2-porosis lobatis basi obtusis interdum obscure apice latis. Ovarium latissime conicum $3\frac{1}{2}$ mm. latum 2 mm. longum basi annulariter glabrum (partibus glabris mellem exsudentibus) supra basin usque ad apicem setulis obtusis brevibus dense obtectum, stylo $2\frac{1}{2}$ cm. longo deorsum tenuissime pubescenti vel subglabro, medio sursum glaberrimo apice haud dilatato, stigmate terminali.

HAB. Fokien : Isan, leg. S. NAGASAWA, 1910, Aprili. (No. 220).

The type I have never seen; description given in BENTH. Fl. Hongk. p. 201, exactly accords with our plant.

Rhododendron (*Eurhododendron*) **pachysanthum** HAYATA. Rami et ramuli validi primum tomentosi demum glabrati, cicatricibus foliorum late triangularibus. Folia ad apicem ramorum approximativis sita elongato-oblonga 8-9 cm. longa $3\frac{1}{2}$ cm. lata ad medium latissima apice acutissima basi rotundata vel obtusa obtuso-rotundata supra glabra basi albo-ferrugineo-tomentosa, (pilis stellatis dense obtectis) demum glabra coriacea, supra costis

angustissime sulcatis subtus prominentibus, venis utraque pagine vix conspicuis, supra sub microscopio minute reticulata, areolis intra reticulum elevatis, venis lateralibus primariis tenuissimis supra tenuiter impressis rectis subtus tenuissime elevatis, petiolis $1\frac{1}{2}$ cm. longis supra sulcatis tomentosis. Gemma foliorum ovoido-cylindrica 3 cm. longa 7 mm. lata, perulis inferioribus cuspidiformibus, superioribus elongatis acutis. Flores ad apicem ramorum 10–20-fasciculati (sed in sensu stricto in racemis brevissimis, rhachidibus 1–2 cm. longis multo brevioribus quam pedicellis) perulis multis involuclati, perulis extimis minutis late triangularibus longe cuspidatis 3 mm. latis, mediocribus majoribus rotundatis 2 cm. longis apice obtusis valde concavis, intimis (vel bracteis) spathulatis 3 cm. longis sursum 1 cm. latis deorsum angustatis attenuatis basi 2 mm. latis sursum latissimis alabastrum florum amplectantibus apice emarginatis ad centrum breve cuspidatis extus dense intus laxe sericeo-hirsutis, bracteolis filiformi-linearibus 1 cm. longis pubescentibus, pedicellis $2\frac{1}{2}$ cm. longis glanduloso-pubescentibus. Calyx brevissimus late 5-dentato-lobatus, lobis late triangularibus acutis margine glanduloso-ciliolatis (ciliolis brevissimis obtusis) extus basin glanduloso-hirsutis. Corolla late campanulata 4 cm. longa totiusque in diametro, tubo late campanulato 2 cm. longo latere dense maculato-punctato, (parte superiore tubi punctata obovata $1\frac{1}{2}$ cm. longa 8 mm. lata), limbo 5-lobato, lobis tubum in longitudine æquantibus rotundatis apice ± emarginatis utrinque glabris. Stamina 10, filamentis in longitudine inæqualibus basi dilatatis, partibus dilatatis 4 mm. longis hirsutis cæterum glabris, antheris ellipsoideis apice truncatis basi obtusis emarginatis non apiculatis. Ovarium cylindricum 5 mm. longum 2 mm. latum pilis brevissimis glandulosis dense obteatum, stylo toto glabro $2\frac{1}{2}$ cm. longo apice vix dilatato, stigmate terminali brevissime 5–6-lobato. Capsula dense pilis brevissimis obtecta cylindrica $1\frac{1}{2}$ cm. longa $\frac{1}{2}$ cm. lata.

HAB. In montibus centralibus, leg. U. MORI, 1911, Aprili. Fl.

Near *R. Morii* HAYATA; but differs from it by the quite glabrous style, and in its leaves which are densely tomentose beneath, and are so impressingly reticulated on the upper surface that intra-reticular areoles are elevated.

Rhododendron (Eurhododendron) rubropunctatum HAYATA sp. nov.

Frutex; rami validissimi, cortice cinerascenti subglabro. Folia versus apicem ramorum approximativis disposita coriacea usque ad 11 cm. longa 3½ cm. lata elongato-oblonga vel oblanceolata a medio sursum latissima apice obtuso-acuta ad summum breve crasso-apiculata basi obtusa utrinque glabra supra in exsiccato opaca subtus flavo-pallida, sub microscopio minute rubro-punctata margine integra desuper recurva, (supra costis impressis, venis primariis tenuissimis impressis vix conspicuis, subtus costis prominentibus, venis primariis lateralibus tenuissime elevatis) utraque glabra, petiolis usque ad 3 cm. longis rugosis subglabris fuscentibus apice latere brevissime subalatis supra angustissime sulcatis. Gemma foliorum ovato-cylindrica 4 cm. longa 8 mm. lata multiseriatim perulata, perulis extimis brevissimis cuspidatis, intimis longissimis oblongis 4 cm. longis. Flores breve racemosi vel fasciculati, racemis terminalibus, rhachidibus 2 cm. longis, longe pedicellatis, pedicellis 4 cm. longis caducissime pubescentibus, perulis multiseriatis extimis minutis late rotundatis glabris, intimis longissimis angustatis 4 cm. longis 8 mm. latis obtusis utraque facie molle denseque sericeo-pubescentibus, bracteis filiformibus hirsutis 1 cm. longis. Corolla late campanulata circ. 5 cm. longa 5-lobata, lobis oblongo-rotundatis 2 cm. longis apice rotundatis vel emarginatis, tubo utraque glabro medio latere superiore purpureo-punctato. Stamina 10, in longitudine inæqualia, filamentis basi ± dilatatis, partibus dilatis 6 mm. longis brevissime denseque hirsutis, cæterum glabris, antheris oblongo-euneiformibus 4 mm. longis 1 mm. latis apice truncatis 2-porosis lobatis basi angustatis lobatis vel emarginatis haud apiculatis. Ovarium ovoideo-conicum 6 mm. longum 4½ mm. latum 5-sulcatum dense hirsutum, stylo 4 cm. longo vix exerto a medio deorsum hirsuto sursum glabro apice dilatato, stigmate terminali brevissime lobulato.

HAB. Mt. Shichiseitonzan, leg. S. SASAKI, Aprili. 1910.

Pyrola LINN.

Pyrola alboreticulata HAYATA sp. nov. (Tab. XXV.) Suffrutex humilis, caules ascendentis cum racemis 15–20 cm. longi, basi foliosi, partibus foliosis 7–5 cm. longis, inter folios squamatis, squamis linearibus acutis circ. 1 cm. longis, a supra basi sursum aphylli supra medium bracteis 1

vel 2 instructi, versus apicem flores 2–3 gerentes. Folia alterna approximata vel remota glabra tenuiter coriacea ovata vel oblonga 3–4 cm. longa $1\frac{2}{3}$ –3 cm. lata apice acuta ad summum minute calloso-mucronata basi rotundata subito ad extremitatem acuta ad petiolum attenuata, æqualia interdum obliqua, margine integra sed remote mucronibus minutis instructa (mucronibus a se circ. 5 mm. remotis) tenuiter marginata vel leviter angustissime recurvata supra in vivo fusco-viridia, ad nervos et venas albo-reticulata, subtus pallidissima, nervis venisque utraque pagine tenuissime elevatis, venis primariis lateralibus utroque latere costæ 4–3 angulo 80° a costa divaricatis sursum arcuatis eas superiorem proximam attingentibus areolas utroque latere costæ 3–4 formantibus, petiolis 3–4 cm. longis laminam in longitudine 2-plo superantibus vel paullo longioribus complanatis supra sulcatis. Racemi 3–4-florati, floribus 1 cm. a se remotis, pedunculis (vel partibus caulis aphyllis) circ. 10 cm. longis 1 mm. in diametro sectionis subangulatis ad angulis subalatis glabris medio 1-bracteatis. Flores declinati apertentes 15–18 mm. in diametro breve pedicellati, pedicellis 4 mm. longis, sub pedicellis singulis 1-bracteati, bracteis linearibus acutis. Sepala 5 (vel lobi calycis) basi \pm connata oblongo-angustata 5–6 mm. longa $2\frac{1}{2}$ mm. lata apice obtusa sursum obscure denticulata vel integra deorsum integra obscure 3–5 nervia basi latissima. Petala 5 obovato-rotundata $7\frac{1}{2}$ –7 mm. longa 6 mm. lata versus marginem tenuissima 3–4-nervia apice rotundata basi ad insertionem 2 mm. lata margine integra. Stamina 10, per paria petalis opposita, filamentis complanatis 6–7 mm. longis basi circ. $\frac{3}{4}$ mm. latis introrse \pm recurvatis 1-costatis, antheris retroflexis oblongis apice (ut videntur) dorso cum filamentis affixis apice extrorse leviter recurvis 2-lobatis, loculis apice in tubum $\frac{1}{2}$ mm. longum productis introrse 1-porosis apice truncatis basi apiculatis latere profunde 1-sulcatis. Ovarium depresso-globosum $3\frac{1}{2}$ mm. in diametro æquans apice impressum, stylo declinato columnari 8–9 mm. longo apice \pm dilatato, stigmate 5 lobato, lobis teretibus. Capsula depresso-globosa apice profunde impressa in sectione verticali obcordata 7–8 mm. in diametro 5 mm. longa 5-lobata loculicide dehiscens. Semina numerosa utroque producta, cum alis linearibus 1 mm. longa $\frac{1}{10}$ mm. lata utrinque truncata.

HAB. Arisan, leg. B. HAYATA et S. SASAKI, Jan. 1912; ad summum Bataiankei, leg. MORI, Juni. 1912.

Near *P. rotundifolia* LINN.; but distinguishable from it by the ovate acute leaves with much fewer lateral veins along which the leaves are white reticulated. There is a species called *P. atropurpurea* FRANCHET (Journal de Botanique IX. p. 372) which I could not examine. It may presumably be different from our plant.

Pyrola morrisonensis HAYATA (Tab. XXVI.) Fl. Mont. Formos. p. 155; *Pyrola elliptica* NUTT. var. *morrisonensis* HAYATA in Tokyo Bot. Mag. XX. p. 18. Corolla late campanulata 8 mm. longa leviter 5-loba, lobis brevibus 3 mm. longis 5 mm. latis rectangularibus apice late truncatis vel rotundatis altiuscule crenulatis, venis lateralibus utroque latere 3, utraque facie glabra. Stamina 5, lobis corollæ alterna, antheris sessilibus ad medium inter sinus et basin corollæ sitis cordato-reniformibus apice emarginatis basi cordatis 1 mm. longis $1\frac{1}{2}$ mm. latis. Staminodia 0. Ovarium globosum glabrum 2 mm. in diametro, stylo 4 mm. longo simplici, stigmate terminali non lobato. Calyx fructifer ± accrescens, sepalis late ovato-triangularibus 5 mm. longis basi latissimis 3–4 mm. latis. Capsula ovoidea 5 mm. longa, sepalis inclusa, loculicide dehiscens, valvis a columna solutis, columna centrali crassa. Semina angulato-fusiformia ± obliqua 1 mm. longa atro-rubra minute reticulata.

HAB. Rakuraku, leg. G. NAKAHARA, Aug. 1905; Mt. Musha, ad 7000 ped. alt., leg. U. MORI (No. 1153); Randaisan, leg. U. MORI, Aug. 1908.

Differs from all the known species of the genus by the sessile anthers, not divided styles of the capsules, and by the absence of the staminodes. It may constitute a new genus *Shortiopsis* (I should propose to call it) on account of the characters just mentioned.

Shortia subcordata HAYATA sp. nov. Ut plantæ præcedentis, sed folia rotundata, 4 cm. in diametro, margine crenata, ad summum crenarum mucronata, basi rotundata vel cordata. Flores minores.

HAB. Shintiku: Kareizan, leg. U. MORI, 1906, Juni., (No. 1422.)

Differs from the preceding plant by the round- or cordate-based leaves.

Shortia transalpina HAYATA sp. nov. Rhizomata erecto-ascendentia basi radices tenues fibrosas emittentia, apice 2–3 ramosa, ramis simplicibus folios et scapum gerentibus. Folia omnia radicalia 5–6 ad apicem rhizomatum sita rotundato-spathulata vel rotundato-ovata longe petiolata; laminæ obovato-spatulatæ vel obovatæ 2 cm. longæ $1\frac{1}{2}$ cm. latæ apice perfecte rotundatae basi subito attenuatae gradatim ad petiolum abeentes utraque glabræ, costis et venis utraque pagine vix conspicuis vel tenuissime elevatis,

venis lateralibus primariis utroque latere 2–3, margine subintegræ sursum utroque latere crenis 3 instructæ (crenis brevissimis vel obscuris) ad sinus inter crenas mucronibus instructæ, petiolis $2\frac{1}{2}$ mm. longis sursum angustissime alatis supra sulcatis basi \pm dilatatis. Flores ignoti. Scapi fructiferi ad apicem ramorum rhizomatum solitarii vel 2–3-fusciculati erecti 7 cm. longi aphylli uniflorati versus apicem 3–4-brakteati basi perulis 2 instructi, perulis linear-ovatis 6 mm. longis apice obtusis, bracteis ovatis vel triangulari-cuspidatis 4 mm. longis. Sepala fructifera \pm accrescentia exteriora ovata 6 mm. longa apice obtusa interiora angustiora 6–7 mm. longa 2 mm. lata circ. 10-nervia apice obtusa. Capsula ovoidea 3 mm. longa, stylo simplici, stigmate capitato leviter 3-lobato, lobis globosis facie muricatis. Semina oblique globoso-ovoidea $\frac{1}{2}$ mm. longa fusco-rubra reticulata, reticulis hexagonis.

HAB. Montibus centralibus 10000 ped. alt., leg. U. MORI, Dec. 1908.

Differs from other species of the genus in its very small form. Here is another species which I could not examine. It is *Shortia thibetica* FRANCH. N. Arch. m. H. N. Paris 2 sér. X. 54.

Fagræa THUNB.

Fagræa Sasakii HAYATA n. sp. (Tab. XXIX). Arbor 10m. alta vel altiora,
rami et ramuli in exsiccato albo-cinerascentes glabri plus minus succulenti.

Folia opposita crassiuscula approximata oblonga oblongo-obovata vel oblongo-ovata usque ad 10 cm. longa $4\frac{1}{2}$ cm. lata ± obliqua apice breve cuspidata ad summum obtusa vel simpliciter obtusa basi cuneata ad extremitatem attenuata utraque pagine glabra, costa supra plana subtus prominenti basi latiuscula ad petiolum abeunti, venis et venuis non conspicuis vel tenuissimis leviter elevatis, pagine supra subglauco-nitida subtus pallidissima, petiolis 1-2 cm. longis basi subito dilatatis stipulam formantibus, stipulis cum petiolis connatis sub-intra-petiolaribus. Flores solitarii terminales, pedunculis validis 2 cm. longis infra medium 2-bracteatis, bracteis oppositis triangularibus 5 mm. longis crassiusculis. Sepala (vel segmenta calycis) 5 subrotundata 6 mm. longa valde imbricata margine hyalina. Corolla (alba?) infundibuliformis crassiuscula $4\frac{1}{2}$ cm. longa 5 cm. in diametro, tubo cylindrico-campanulato 3 cm. longo, lobis 5 patentibus rotundato-oblongis 2 cm. longis $1\frac{1}{2}$ cm. latis apice rotundatis basi non vel leviter contractis margine integris vel obscure denticulatis tenuibus, venis et venuis longitudinaliter reticulatis. Stamina 5, filamentis a basi usque ad medium cum corollæ tubo adnatis, partibus liberis 1 cm. longis complanatis, antheris oblongis 8 mm. longis 4 mm. latis utrinque obtusis basi alte 2-lobatis, lobis arcte approximatis, dorsifixis apice obtusis connectivis leviter visis, connectivis linearibus, loculis 2 solidis. Ovarium ovoideum glabrum 5 mm. longum apice ad stylum $1\frac{1}{2}$ cm. longum attenuatum, stigmate dilatato cupuliformi. Bacca ovoidea $3\frac{1}{2}$ cm. longa apice acuta breve apiculata viridis, sub exocarpio gummi exudens.

HAB. Kōshūn : Hieranzan, leg. B. HAYATA et S. SASAKI, Aug. 1912, fructus!; S. SASAKI, Feb. 1909, flores!

Near *Fagraea obovata* WALL., but differs from it in having much thinner shorter and broader leaves with an obtusely cuspidate apex. The structure of the anther-cells is very peculiar. They are perfectly solid, and in cross section there is seen practically no room for pollens. The anthers are apparently constituted of parenchymatous cells with numerous trabecules. On the surface of the anther-cells, there is a slit or rather a groove, and there we can find some pollens evidently scattered along the groove.

Boragineæ.***Ehretia* LINN.**

Ehretia glaucescens HAYATA sp. nov. Arbor: truncus erectus, versus apicem ramosus. Rami teretes, cicatricibus foliorum elevatis. Folia obovato-oblonga vel obovato-lanceolata apice abrupte acuminata vel breve caudata basi cuneata attenuata supra medium latissima 11 cm. longa 4 cm. lata in vivo supra viridissima nitida subtus glauca chartaceo-membranacea, in exsiccato opaca, integerrima, venis lateralibus primariis utroque latere costæ 4–5 tenuissimis in vivo non visis, in exsiccato utraque pagine tenuissime elevatis, petiolis 1– $\frac{1}{2}$ cm. longis supra sulcatis. Flores paniculato-cymosi albi. Cymæ terminales paucifloratæ, (exceptis pedunculis) 2–3 cm. longæ totiusque latæ, pedicellis ultimis 5–3 mm. longis interdum brevissimis subnullis apice peltato-dilatatis cum floribus articulatis, bracteis et bracteolis nullis. Calyx subglobosus vel obovatus 1 $\frac{1}{2}$ mm. longus vel longior utrinque glaber 5-lobatus, lobis rotundatis vel oblongis apice obtusis vel rotundatis $\frac{1}{2}$ – $\frac{2}{3}$ mm. longis. Corolla campanulato-hypocratheriformis utrinque glabra, tubo 4–5 mm. longo basi 1 mm. lato, apice gradatim dilatato, apice 3 mm. lato, limbo-5-lobato, lobis obovatis vel oblongis apice rotundatis 2–3 mm. longis integris reflexis. Stamina 5 ad medium tubi affixa longe exserta cum lobis corollæ alterna, filamentis vel partibus liberis filamentorum 5 mm. longis reflexis filiformibus, antheris late globosis a dorso compressis didymis, loculis fere distinctis a dorso medio leviter connatis $\frac{3}{4}$ mm. latis. Ovarium ovoideum 1 mm. longum glabrum, stylo 7–8 mm. longo filiformi apice 2-lobato glabro, lobis 1–2 mm. longis apice ± dilatatis truncatis stigmatosis. Fructus globosus 1 cm. in diametro 4-pyrenus, pyrenis late oblongis 6–7 mm. longis 5 mm. latis complanatis leviter recurvis dorso irregulariter alte reticulate foveolatis facie planis vel alte foveolatis. Semina non visa.

HAB. Kizan prope Mai, leg. B. HAYATA et S. SASAKI, Juli., 1912.

Near *E. longifolia* CHAMP; but differs from it by the much smaller corolla and rounded calyx-lobes. Nothing like this in the Indian, Chinese, Honkong and Japanese flora.

The plant was first collected by Mr. S. SASAKI and myself at Kisan near Maisha. The greenish leaves, which are shining above, but glaucous beneath, remind me of those of the lauraceous plants. Flowers are white and scentless. I saw another example of this tree at Kappanzan.

Ehretia longifolia CHAMP.; BENTH. Fl. Hongk. p. 234; FORBES et HEMSL. Ind. Fl. Sin. II. p. 145.

Ehretia lœvis MATSUMURA (non ROXB.) in MATSUM. et HAYATA Enum. Pl. Formos. p. 254.

HAB. Kusukusu, leg. C. OWATARI Mart. 1898; B. HAYATA et S. SASAKI Juli. 1912.

It was found by Mr. S. SASAKI and myself at a sunny place on a mountain ridge at Kusukusu. This is the only example I have ever seen in my excursions. The flowers are perfect white. They are much shorter than those described in BENTH. Fl. Hongk. Tube of the corolla is 1 cm. long, lobes are 4 mm. long.

Ovarium ovoideum 1 mm. longum, apice ad stylum 1½ mm. longum abeuns, stylo apice dilatato infundibuliformi 3-lobato.

HAB. Monte centrali, leg. U. MORI, Dec. 1909.

Near *C. Dæderleinii* ENGL., differs from it by the glabrous flowers and ovately oblong leaves.

Cinnamomum Kanahirai HAYATA sp. nov. Rami validiusculi, ramulis validiusculis glabris fusco-purpurascens in exsiccato. Folia coriacea oblonga ovato-oblonga usque ad 7 cm. longa usque ad 4 cm. lata apice subito acuminata vel acuminata basi obtusa rotundata acuta ad extremitatem subito-acuta pinnivena vel 3-nervia vel 5-nervia, (nervis basilaribus tenuissimis, nervis lateralibus supra basin usque ad 3 mm. connatis), supra subnitida, costis et venis utraque pagine tenuiter elevatis, venulis minutissime reticulatis vix conspicuis, petiolis 1–2 cm. longis sursum subalatis supra late sulcatis. Flores ignoti. Tubus perianthii fructifer persistens campanulato-cupuliformis 1 cm. in diametro. Bacca depresso-globosa 13 mm. longa 15 mm. in diametro apice depresso-truncata. Semina globosa 10 mm. in diametro testa crustacea.

HAB. Nanshōhichō: Kali-zenzan, ad 4000 ped. alt., Oct. 1912, leg. R. KANAHIRA.

Near *C. micranthum* HAYATA, but differs from it by the much larger fruits and in the leaves which are sometimes 3-nerved, and strong scented.

Cinnamomum macrostemon HAYATA sp. nov. Ramuli recti graciles glabri. Folia chartacea supra subnitida subtus opaca ovato-lanceolata ovato-oblonga vel oblongo-lanceolata apice acuminata ad summum obtusa basi acuta vel subito acuta 10 cm. longa 3 cm. lata trinervia, nervis lateralibus supra basin usque ad 3 mm. connatis, nervis et venis supra tenuibus subtus tenuiter prominentibus, venis primariis lateralibus et venuis tenuissimis, petiolis 1 cm. longis supra late sulcatis. Flores cymoso-paniculati, paniculis axillaribus vel terminalibus 2-3 cm. longis, rhachidibus pubescentibus tetragonis, pedicellis 4-5 mm. longis. Perianthium late campanulato-rotatum utrinque pubescens alte 6-lobatum, lobis angustato-elongato-oblongis 6 mm. longis 2 mm. latis apice obtusis. Stamina perfecta 9, 5 mm. longa, (filamentis hirsutis, antheris angustatis 2 mm. longis $\frac{1}{2}$ - $\frac{2}{3}$ mm. latis); ordinis I. et II. glandulosa, antheris introrsum 4-locellatis; ordinis III. utroque latere glandula sessili ad medium filamentorum instructa, antheris extrorsum 4-locellatis; staminodia ordinis IV. 3 mm. longa apice sagittæformia hirsuta. Ovarium obovoideum 1 mm. longum, stylo 3 mm. longo, stigmate dilatato 3-lobato.

HAB. Tainan, leg. S. NAGASAWA, Aprili. 1910, (No. 155).

Cinnamomum micranthum HAYATA n. n.

Machilus micranthum HAYATA, Ic. Pl. Formos. II. p. 130.

Cinnamomum nominale HAYATA n. n. *Cinnamomum Camphora* NEES et EBERM. var. *nominale* HAYATA in MATSUMURA et HAYATA Enum. Pl. Formos. p. 349. Suffrutex semper humilis 1 m. alta nunquam altior nunquam arborescens. Rami in exsiccato fuscentes ramosi. Folia tenuiter coriacea vel chartacea oblonga oblongo-ovata vel oblongo-rhomboidea usque ad 7 cm. longa circ. 2-3 cm. lata, apice acuminata basi vel subito attenuata vel cuneata 3-nervia, nervis basi supra basin 1 cm. connatis, (præterea nervis basilaribus tenuissimis a basi distinctis), supra nitida subtus opaca, (venis secundariis transversis utraque pagine tenuissimis non elevatis, nervis utraque pagine tenuissime elevatis) margine nervo-marginata, petiolis 1-2 cm. longis supra sulcatis. Flores cymosi, cymis pauci- et laxi-floratis axillaribus 3-6 cm. longis. Perianthium subrotatum

4 mm. in diametro late 6-lobatum, lobis extus subglabris intus hirsutis oblongis 1 mm. latis obtusis. Stamina perfecta 9, I. et II. ordinis eglandulosa, antheris introrsum 4-locellatis, ordinis III. glandulis stipitatis instructa, antheris extrorsum 4-locellatis; ordinis IV. staminodia rhomboideo-cuspidiformia stipitata. Ovarium globosum, stigmate dilato. Calycis Tubi fructiferi campanulato-cupuliformes 4-5 mm. in diametro; baccis globosis 6 mm. in diametro basi rostratis.

HAB. Kōshūn, Kuraru, leg. B. HAYATA, Mai. 1912.

This was described as a variety of the common camphor tree. It is a shrub nearly 1 m. high. It does not produce camphor. The flowers are a little smaller than those of the camphor tree. The apical portions of staminodes are not sagittate, but rhombic. It is better be regarded as specifically distinct from the latter.

Cinnamomum obovatifolium HAYATA sp. nov. Rami glabri. Folia obovata tenuiter coriacea 3-4 cm. longa 1-2 cm. lata apice rotundata obtusa vel rarius acuta basi obtusa vel cuneata supra subnitida subtus subglauca pinninervia, costis et venis supra planis non elevatis, subtus tenuissime elevatis sed distincte coloratis, venulis minute reticulatis, venis lateralibus primariis utroque latere costæ 4 apice arcuatis cum venis superioribus areolam formantibus, petiolis brevibus 5 mm. longis supra late sulcatis. Cymæ axillares paucæ-floratæ 2 cm. longæ. Perianthium 6-lobatum extus glabrum intus subglabrum basi barbatum. Cæterum ut *C. Camphoræ*.

HAB. Kusukusu, leg. B. HAYATA et S. SASAKI, 1912, Juli.

Near *C. reticulatum* HAY., but differs from it by the pinninerved leaves and much smaller flowers.

Cinnamomum pseudopedunculatum HAYATA sp. nov. Rami et ramuli recti graciles rubescentes vel pallidiusculi. Folia in magnitudine et forma variabilima tenuiter coriacea ovata oblonga ovato-oblonga vel ovato-lanceolata apice obtusissima obtusa acuta vel acuminata, sed ad summum semper obtusa, basi rotundata obtusa acuta breve attenuata 4-9 cm. longa 1½-4½ cm. lata 3-nervia, nervis basi usque ad 5-10 mm. connatis, præterea 2 nervis basilaribus tenuibus a basi solutis, nervis et venis utraque

pagine leviter elevatis vel supra planis basi reticulatis, venis transversis non distinctis, supra nitida subtus \pm glauca, petiolis 1–2 cm. longis complanatis supra late sulcatis sursum \pm alatis. Cymæ paucifloratæ 3-floratæ pedunculatæ axillares, pedunculis 1 cm. longis glabris. Perianthium 5-lobatum, lobis 6 oblongo-rotundatis 2 mm. longis apice obtusis extus glabris intus hirsutis margine sub microscopio denticulatis. Stamina perfecta 9, filamentis hirsutis, ordinis tertii glandulis sessilibus utroque latere medio instructis; staminodia sagittæformia. Ovarium ovoidicum apice ad stylum abeuns, stigmate capitato 3-lobato. Pedunculi fructiferi erecti 1½ cm. longi, pedicellis fructiferis 1½ cm. longis erectis, tubo perianthii persistenti dilatato cupuliformi 4 mm. in diametro. Fructus ellipsoideus 8 mm. longus apice rotundatus ad centrum 1-punctatus.

HAB. Bonin : Chichijima et Hahajima, leg. H. HATTORI, 1905, Aug.

Near *C. pedunculatum*, but differs chiefly by the venation of the leaves, shorter peduncles and less-flowered cymes.

Machilus NEES.

Machilus longipaniculata HAYATA sp. nov. (Tab. XXX.) Rami in exsiccato nigricantes glabri. Folia lanceolata obovato-lanceolata vel oblongo-lanceolata tenuiter coriacea vel chartacea apice acuminata basi cuneato-obtusa 10–13 cm. longa 3–3½ cm. lata, in exsiccato utraque pagina opaca, \pm rubescens subtus \pm glauca, pinninervia, costis supra impressis subtus elevatis, venis lateralibus primariis tenuissimis, petiolis 2 cm. longis. Paniculae longissimæ 10–20 cm. longæ, ad axillas foliorum superiorum, pedunculis longissimis, ramis brevibus 1½ cm. longis, ad apicem ramorum floribus 3–6-fasciculatim dispositis, pedicellis ultimis 4 mm. longis. Perianthium 6-lobatum, lobis patentissimis extus breve hirsutis intus parcissime hirsutis exterioribus anguste oblongis 3½ mm. longis apice obtusis interioribus latioribus, tubo dense hirsuto. Stamina perfecta 9, 2 mm. longa, filamentis glabris. Ovarium cum stylo glabrum.

HAB. Uraisha, leg. N. KONISHI, 1910, Mart. (Fl.).

Machilus longisepala HAYATA sp. nov. Rami graciles in exsiccato fuscentes. Folia tenuiter coriacea vel chartacea, oblongo-oblanceolata apice

Fig. 21.

Actinoiaphne citrata (BLUME.) 1, a branch; 2, a leaf; 3, a flower-umbel; 4, a bract; 5, a flower; 6, 7, calyx-lobes; 8, limb of the calyx, expanded; 9, 10, stamens of one kind, seen from different sides; 11, 12, stamens of another kind; 13, 14, 15, stamens of another kind; 16, a rudimentary ovary; 17, a branch with a fruit; 18, a fruit; 19, vertical section of the same. Fig. 1, 2 and 17, $\times \frac{1}{4}$; others are variously magnified.

acuta vel acuminata ad summum obtusa basi cuneata vel cuneato-obtusa 6–8 cm. longa 2 cm. lata, costis supra sulcatis subtus prominentibus, venis lateralibus primariis tenuissimis subtus leviter elevatis, petiolis 1 cm. longis supra late sulcatis. Paniculæ 4–5 ad apicem ramorum fasciculatæ 8 cm. longæ, pedunculis 5 cm. longis, ramis 1–1½ cm. longis, floribus ad apicem ramorum 2–3–4– fasciculatim dispositis, pedicellis ultimis 3 mm. longis. Perianthium 6-lobatum utrinque hirsutum, lobis oblongis. Stamina perfecta 9, staminodia 3.

HAB. Kusukusu.

Notaphœbe BLUME.

Notaphœbe Konishii HAYATA n. n.= *Machilus Konishii* HAYATA Mater. Fl. Formos. p. 240.

The plant should better be referred to *Notaphœbe*, for the staminodes of the fourth order are very small and subulate, the segments of the perianth are rather thin, and the plant does not look like a species of the *Machilus* allies.

Actinodaphne NEES.

Actinodaphne citrata (BLUME.) (Fig. 21.). = *Litsea citrata* BLUME; HAYATA Mater. Fl. Formos. p. 247.

OBSERV. Rami glabri nigricantes, ramulis gracilibus. Folia alterna petiolata subpersistentia membranacea lanceolata 7 cm. longa 16 mm. lata apice acuminata basi acuta vel obtusa, costis et venis utrinque paullum elevatis, venis primariis gracillimis, petiolis 8 mm. longis. Umbellæ florum racemose dispositæ, racemis axillaribus 1½ cm. longis, pedicellis umbellarum 8 mm. longis, vel racemis in umbellam unam reductis. Umbellæ 4-floratæ, basi bracteis 4 persistentibus globosis 4 mm. longis 5-nervatis apice rotundatis membranaceis glabris. Perianthium 6-partitum glabrum, segmentis late ovatis obtusis 2 mm. longis 1½ mm. latis integris vel denticulatis. Stamina 9 omnia perfecta 2 mm. longa segmento perianthii æqualia, filamentis glabris linearibus, ordinis primarii et secundarii eglandulosa, ordinis tertii glandula breve stipitata utrinque aucta, antheris omnibus introrsum 4-locellatis. Rudimentum ovarii minutum. Fl. ♀: ignoti. Bacca globosa nigricans 5 mm. longa, perianthii tubo non accrescenti insidens, segmentis calycis deciduis.

Actinodaphne morrisonensis HAYATA n. n. *Litsea morrisonensis* HAYATA Mater. Fl. Formos. p. 250.

Actinodaphne nantœnsis HAYATA n. n. *Litsea nantœnsis* HAYATA Mater. Fl. Formos. p. 251.

Litsea LAM.

Litsea Kawakamii HAYATA sp. nov. Arbor, ramis robustis subglabris. Folia alterna in magnitudine variabilia ovato-lanceolata vel obovato-lanceolata vel lanceolata 25–40 cm. longa 6–15 cm. lata apice obtusa cuneato-obtusa vel acuta basi cuneata ad petiolum decurrentia chartacea vel chartaceo-membranacea vel chartaceo-coriacea margine integra utraque pagine glabra subtus glauca, costa supra plana 4 mm. lata subtus prominenti, venis lateralibus supra planis subtus elevatis gracilibus utroque latere costæ circ. 20 subrectis prope marginem evanescentibus a costa circ. 50° divaricatis, venuis minute reticulatis, reticulis utraque elevatis, margine integerrima, petiolis 2½ cm. longis supra late canaliculatis basi non incrassatis. Cymæ axillares fructiferæ acutæ incrassatæ, ramis incrassatis, pedicellis fructiferis valde acutis 1½ cm. longis validis cum calyce continuis. Cupula calycis fructiferi patelliformis 3 cm. in diametro 7 mm. alta, cicatricibus planis 17 mm. in diametro. Bacca compresso-globosa 3 cm. in diametro 22 mm. alta, in cupula insidens, 1-sperma primum alba demum rubra. Semina obovato-compresso-globosa 2½ cm. in diametro 2 cm. longa apice subplana basi rotundata, testa membranacea laevi; albumen 0, cotyledones semi-globosæ, caudicula infra apicem immersa.

HAB. Kōtōshō, leg. Y. TASHIRO et T. KAWAKAMI, Aug. 1912.

Very imperfect specimen. Through the courtesy of Mr. E. D. MERRILL, Bureau of science, Manila, I was able to find that it belongs to *Litsea* and is closely allied to the Philippine *L. Garciae* VID. (in Rev. Pl. Vasc. Filip. p. 228). I have compared our specimens with the Philippine species, and found that ours are different from the Philippine, so far as I can judge through the description of the latter, in having cuneately based leaves and smaller fruits.

Tetradenia NEES.

Tetradenia acuminatissima HAYATA. sp. nov. Rami graciles in exsiccato fulvescentes glabri. Folia ovato-lanceolata vel lanceolata tenuiter coriacea vel chartacea 6–9 cm. longa 18–25 mm. lata apice gradatim acuminata vel subito acuminata ad sumnum obtusa basi obtusa vel acuta pinninervia, venis lateralibus primariis utroque latere costæ 5 a costa angulo variabilimo egressis, costis supra elevatis subtus sub-planis, venis supra tenuissime sed distincte elevatis subtus planis distinctis, supra subnitida, petiolis 1–1½ cm. longis. Fl. ♂ : alabastrum cymæ globosum axillare vel laterale, floribus fasciculatis, fasciculis breve pedunculatis; flores apertientes non visi; stamina 6. Fl. ♀ : flores breve pedicellati 3–4-fasciculati, fasciculis sessilibus 2–4 ad pedunculos breves sitis, pedunculis lateralibus vel axillaribus brevissimis 3 mm. longis; fasciculis florum sessilibus basi 1-bracteatis, bracteis semi-rotundatis 1 mm. longis 2 mm. latis basi latere subauriculatis incrassatis; bracteis involueri fasciculorum rotundatis oblongis valde concavis 3 mm. longis basi contractis margine ciliatis dorso parce hirsutis, pedicellis 3 mm. longis dense hirsutis. Perianthium 4-lobatum, lobis concavis obovato-oblongis 2 mm. longis. Staminodia 6–8, exteriora eglandulosa linearia 1½ mm. longa hirsuta, interiora ± longiora utroque latere glandulis sessilibus instructa. Ovarium obovoideum 1 mm. longum, stylo æquilongo hirsuto, stigmate oblique 2-lobato. Fructus globoso-ovoideus 7 mm. longus, perianthiis persistentibus, pedicellis hirsutis 1 mm. longis.

HAB. Tōzan, leg. G. NAKAHARA, 1907, Nov. (Fr.); Arisan, leg. S. SASAKI, 1911, Mart. Fl. ♀.

Excæcaria Kawakamii HAYATA n. n.=*Excæcaria formosana* HAYATA et KAWAKAMI n. sp. in Sched. (non HAYATA). Frutex? Rami apice dense foliati. Folia alterna coriacea obovato-lanceolata vel obovato-elliptica $11\frac{1}{2}$ cm. longa 3 cm. lata apice obtusa deorsum gradatim cuneatimque angustata ad extremitatem subito attenuata ad petiolum attenuata margine integerrima desuper revoluto-recurvata utraque pagine glaberrima, costa supra tenuiter subtus prominente elevata, venis primariis utraque pagine tenuiter elevatis subtransversis rectis vel irregulariter subramosis, supra nitida subtus pallidiora, petiolis $1\frac{1}{2}$ cm. longis complanatis. Spicæ ad apicem ramorum fasciculatæ filiformes erectæ 10 cm. longæ unisexuales vel bisexuales generaliter sursum fl. ♂, deorsum fl. ♀ gerentes. Fl. ♂: basi 1-bracteati, bracteis late rotundatis $1\frac{1}{2}$ mm. latis $1\frac{1}{3}$ mm. longis apice breve cuspidatis crassiusculis margine erosis basi glandula 2 instructis, pedicellis $\frac{1}{2}$ mm. longis incrassatis glabris. Sepala 3 oblongo-triangularia $1\frac{1}{3}$ mm. longa margine paucे denticulata apice attenuato-cuspidata. Stamina 3, filamentis a basi divaricatis \pm continuis 1 mm. longis glabris, antheris reniformibus 1 mm. latis $\frac{1}{2}$ mm. longis apice breve apiculatis. Fl. ♀: basi 1-bracteati, bracteis latissimis $1\frac{1}{2}$ mm. latis $\frac{1}{2}$ mm. longis apice medio mucronatis, pedicellis 1 mm. longis incrassatis.

Sepala cordato-rotundata $1\frac{1}{2}$ mm. longa totiusque lata apice triangulari-acuta mucronata paucे denticulata vel mucronibus ciliiformibus 1-2 utroque latere margine instructa basi utroque latere glandulis instructa. Ovarium obovoideum $1\frac{1}{2}$ mm. longum apice ad stylum crassum abeuns, stylo 3-fido, segmentis incrassatis patentibus recurvatis.

HAB. Kwashōtō, leg. G. NAKAHARA, Feb. 1906, Typus! (No. 948).
Kōtōshō, leg. U. MORI (No. 2476).

Near *Excæcaria philippinensis* MERRILL., but differs from it by the quite obtuse leaves.

Urticaceæ.

Ulmus LINN.

Ulmus Uyematsui HAYATA sp. nov. (Tab. XXXII.) Arbor? Folia elliptica vel oblonga \pm obliqua 10 cm. longa $4\frac{1}{2}$ cm. lata apice cuspidata, (cuspidibus $1\frac{1}{2}$ cm. longis acuminatis), basi oblique obtusa ad extremitatem \pm cordata chartacea supra parcissime subtus densiuscule pubescentia margine tenuiter duplikato-serrulata, costis venisque supra tenuiter impressis subtus distincte elevatis, venis rectis mediis angulo 40° a costa egressis simplicibus vel prope apicem furcatis, ad axillas inter costam et venas dense pubescentia, venuis secundariis inconspicuis inter venas primarias transverse minuteque reticulatis, petiolis brevissimis 4 mm. longis. Racemi axillares breves 1 cm. longi dense florati, rhachidibus pedicellisque breve dense pubescentibus, pedicellis ternatim fasciculatis, sub fasciculis singulis bractea una instructis, bracteis oblongis 5-6 mm. longis scariosis sursum ciliolatis cæterum glabris, pedicellis 6 mm. longis ad medium articulatis. Calyx campanulatus 3 mm. longus apice totiusque latus sursum 5-6 lobatus, lobis obovato-rotundatis 1 mm. longis totiusque latis apice rotundatis margine ciliatis cæterum glabris. Fructus compressus siccus oblique obovatus ala undique cinetus, cum alis 1 cm. longus totiuque latus, alis latis membranaceis radiatim reticulato-venosis a basi stipitis usque ad apicem ramorum styli extensis, stipitibus 2 mm. longis; pericarpo chartaceo. Semen sub apice affixum pendulum plano-com-

pressum; albumen 0; embryo rectus, cotyledonibus planis æqualibus, radicula parva supra.

HAB. Mt. Arisan, leg. K. UYEMATSU, Mart. 1913.

Near *U. castaneifolia* HEMSL.; but differs from that by the much thinner leaves without any particular beards on the axils of the primary lateral veins.

globoso-pyramidalis 1 cm. longa totiusque lata, facie tenuissime adpresso pubescens, basi truncata, apice acuto-apiculata.

HAB. Nantōchō: Mt. Shojōdaisan, ad 6000 ped. alt., leg. S. KATŌ, 1910, Dec. (Fructus).

Castanopsis formosana HAYATA sp. nov. Rami et ramuli atro-rubro-purpurascentes hac at illac cinerascentes, lenticellis-rotundatis elevatis minutis notati. Folia tenuiter coriacea ovato-oblonga 8–9 cm. longa 3–3½ cm. lata apice acuminata basi acuta vel late cuneata supra basin usque ad apicem valde dentata, (dentibus in utroque latere 6–7, 1½–1 cm. a se remotis apice leviter incurvis acutis, sinibus inter dentes rotundato-obtusis), supra glabra subtus cinereo-glaucescentia, costis et venis supra planis subtus distincte elevatis, venis primariis lateralibus utroque latere costæ 7–8, a costa angulo 45° egressis apice ad apicem dentum attingentibus tenuibus, petiolis glabris 13 mm. longis basi ± incrassatis. Spicæ florum ♂: ad apicem ramulorum terminales vel versus apicem axillares basi ramosæ, ramis longissimis elongatis erectis 10 cm. longis, floribus spicatum ad nodos 2–3 aggregatim dispositis, bracteis 3–4 ad basin florum aggregatorum dispositis. Perianthii segmenta 5 obovato-oblonga 1½ mm. longa extus parce intus dense longeque hirsuto-barbata, staminibus 9–10, filamentis filiformibus longe exsertis patentibus 4½ mm. longis parce hirsutis vel glabratis, antheris globosis ½ mm. in diametro. Spicæ fl. ♀ ignotæ. Fructus ad rhachidem incrassatam spicatum dispositi spinosi, in circumscriptione globosi 2 cm. in diametro, spinis teretibus usque 1 cm. longis 1½ mm. latis rectis breve tomentosis dense dispositis. Glans singularis acuta apiculata floccoso-tomentosa.

HAB. Hieranzan, leg. T. KAWAKAMI et S. SASAKI, 1910, Feb. (Fl. et Fr.).

This is very near *C. tribuloides* var. *formosana* SKAN. It may perhaps be identical with SKAN's variety. But the present plant is so widely different from *C. tribuloides* that we are forced to regard it as specifically different from the named species.

Castanopsis subacuminata HAYATA sp. nov. *Castanopsis indica* HAYATA Fl. Mont. Formos. p. 204. Rami dense pubescentes. Folia ovato-acuminata apice acuminata 12 cm. longa 3½ cm. lata apice acuminata, basi acuta vel cuneata margine grosse leviterque serrata, (serris ascendentibus introrse recurvis a se 8 mm. remotis brevissimis 2 mm. longis latissimis apice mucronatis), margine inferiore parte cuneata integra supra glabra subtus dense brevissime pubescentia, costis et venis supra leviter impressis subtus

prominentibus, venis lateralibus utroque latere costæ circ. 15 rectis angulo 40° a costa divaricatis, ad apicem serrarum attingentibus, petiolis 1 cm. longis supra planis leviter sulcatis infra convexis pubescentibus. Spicæ ♂ paniculatæ, ramis gracilibus circ. verticaliter erectis vel ascendentibus 10–15 cm. longis dense pubescentibus basi ad insertionem 1-bracteatis, bracteis ovato-triangularibus 4 mm. longis 3 mm. latis crassiusculis apice obtusis vel 2-dentatis vel emarginato-rotundatis basi ad insertionem truncatis non contractis utroque dense pubescentibus; bractea sub flore 1–3 una sita late rotundata acuta vel bi-cuspidata integra vel 2-loba, exteriore hirsuta, interiore glabra 1 mm. longa, bracteolis sub flore sitis $\frac{1}{2}$ mm. longis triangularibus acutis. Fl. ♂ in bractea singula 1–3, 1–2-bracteolati. Perianthium 6–7 partitum vel lobatum, lobis 3 exterioribus 3 interioribus, extus subglabris intus hirsutis vel longi-barbatis oblongis obtusis 1–1 $\frac{1}{2}$ mm. longis extus 1-costatis, costis latis elevatis. Stamina 15–20, filamentis filiformibus 2 $\frac{1}{2}$ mm. longis, antheris 2-orbicularibus, loculis distinctis. Rudimenta ovarii minuta barbata. Spicæ ♀. terminales vel axillares pauci-ramosæ vel simplices 20 cm. longæ, rhachidibus latere compressis. Fl. ♀ in bractea una solitarii 2-bracteati, bracteis triangularibus. Perianthium 6-lobum, ovarium semi-includens. Styli 3 erecti, ad apicem 1-foveolati vel impressi stigmatosi.

HAB. Kashinro, C. OWATARI, III. 1898.

The present plant was formerly referred to *C. indica*; but the plant is slightly different from the Indian species, as is seen from the specimen of the species collected by Mr. T. KAWAKAMI in Mungpoo at an elevation of 8000 ft. (Herb. Taihoku, Mungpoo 8000 ft. India. Jan. 26, 1912, Fl. leg. T. KAWAKAMI). The leaves of this new plant are ovately acuminate, broadest in the lower portion, while those of the Indian species are obovate, broadest in the upper portion.

Embryo basilaris, albumen ruminans.

HAB. Kōtōshō, leg. Y. TASHIRO, Aug. 1912.

Very interesting palm. Through the courtesy of Mr. E. D. MERRILL, I have learnt that the palm is closely allied to the Philippine *Pinanga Barnesii* BECC. Our palm is, however, different from that species in its taller and thicker trunks, and in its smaller fruits. It was first, some years ago, discovered by Mr. Y. TASHIRO in the island of Kōtō (Botel Tobago). It grows in a dense forest in the central parts of the island on

an altitude of about 1000 ft. It extends sometimes over an elevation of 1800 ft. above the level of the sea, when the elevation is surrounded by the several mountain ranges. The palm is of rather small size. The trunk is usually 6-7 ft. high, and even the tallest does not exceed 15-16 ft. It is generally larger than that of *Areca Catechu*, attaining 1.6-2.2 ft. in circumference, urceolately swollen at both top and base. It is ashy-white, rugose; scars of leaves are annualarly arranged, and 3.3-5 inches distant at the basal parts of the trunks, but gradually remoter towards the top; sheath nearly 3 ft. long, iron-brown. Leaves terminal, (excepting vagina) 7-8 ft. long (including petioles), 3-4 ft. broad pinnate, deep green shining, petioles 2 ft. long. Panicles 3-4-5, hanging from the apical portions of the trunks, branched; branches nearly 30, 7-9 inch long, each bearing nearly 40 fruits. Fruits sessile deep scarlet.

I. Introduction.

More than thirty years ago, there was recorded from Kiushiu (TASHIRO), a southern island of Japan, a flowering parasite of very peculiar character widely different from any other plant, whether parasitic or not, then known in Japan. The record of the parasite then given was an extremely imperfect one, with a very rough sketch of a specimen of a peduncle without any attaching organ, and apparently lacking one of the genital organs. For a long time, it did not come to the notice of any professional botanist, either

* An article in German on this same subject appeared in ENGL. Bot. Jahrb. LI. Heft.-1, pp. 164-176, T. I.

at home or abroad, until nearly five years ago, when another specimen also in a very imperfect state was found in Shikoku, another southern island of Japan. The plant was then first examined by T. MAKINO (MAKINO I., p. 326), who with some hesitation regarded it as a plant possibly referable to the Rafflesiaceæ. His opinion was based presumably on a consideration of only the external features of the plant, and not upon a careful examination of the morphological structure of the flowers, and certainly without studying its attaching organ or its anatomical character. It was considered by him to be a plant representing a new genus, and was then first named *Mitrastemon Yamamotoi* Mk. Later on, towards the end of 1911, an exhaustive description of the plant, beautifully illustrated, was given by T. MAKINO in the Journal of the Tokyo Botanical Society. In this article he regarded the plant as representing a new family, the Mitrastemonaceæ, distinguishable from the Rafflesiaceæ by its having a gamophyllous cylindrical and truncate perianth, a mitriformed staminal column and a superior ovary. A little previously, i.e. in 1910, another plant much like the former was found in the southern part of the island of Formosa. This parasite, being far larger than the Japanese plant and differing slightly from the latter, was consequently described by me as a new species, *Mitrastemon Kaiwasasakii* Hy. (HAYATA I. p. 112). In my then description of this new parasite, I was merely following MAKINO, and did not in detail go into the systematic position of the plant. Later on, I became strongly of opinion that the plant belonged to the Rafflesiaceæ, and accordingly transferred it to that family (HAYATA II., p. II.).

As I have said above, *Mitrastemon* was first referred to the Rafflesiaceæ, then was considered to represent a new family, and even to be comparable to the Nepenthaceæ (MAKINO II., p. 252). Consequently, the systematic position of the plant has been much confused. In the present paper, it is my desire to make a few remarks about the systematic position of the parasite when considered from the point of a comparision of its morphological and anatomical characters with those of other families; and more especially from a deliberate consideration of the different characters which separate our parasite from all the plants at present referred to the Rafflesiaceæ, to decide

whether the said characters necessarily prevent it from being taken into the same family, or in other words whether the differences are such as separate genus from genus or family from family.

So far as I am aware, a discussion of this kind on *Mitrastemon* has never been undertaken. Moreover, there is no work on the anatomy of the intramatrical tissue, the flower-peduncle, or the structure of the ovules, which collectively make up a group of characters which are as important as any other floral characters for the determination of a systematic position. In this paper, I shall first consider the morphology of the plant both external and internal, especially so far as is necessary for the present discussion and then in its bearings on the systematic position of the plant itself.

II. External Morphology of *Mitrastemon*, especially with regard to its systematic Position.

*The plants are leafless, unbranching, single flowered parasites growing on exposed roots of *Quercus cuspidata*. Roots over 1 cm. in diameter frequently bear numbers of these plants. The volva is always in colony, separate, or confluent below, short, globose, erect, sessile, dark fulvous. Peduncles simple, thick, straight or sometimes slightly curved, terete or subcompressedly terete, smooth on surface, provided with scales. Scales opposite in 5 or 6 pairs, imbricate, decussate, concave, margin adnate to the peduncles at the base, forming tubes in the basal portions, where honey-like fluids are secreted in abundance.** Scales are more or less shining owing to a small quantity of a fluid secreted on the surface, especially when the flowers are in bloom. Flowers are always hermaphrodite and usually regular, but sometimes more or less didlinous, especially in the earlier stage of flower-development. Of the four primordial leaves which compose the perianth, the front and back ones are usually broader than the lateral pair. In many cases, they, in a

* The reader is requested to refer to the original description of *Mitrastemon Yamamotoi* Mr. contributed by Mr. T. MAKINO to the *Tōkyō Bot. Mag.* XXV. p. 252, T. VII. and *M. Kawasakii* Hay. in the same journal, XXVI. p. 112.

** In the flowering season, this honey attracts large numbers of a bird resembling a Japanese white eye, (*Zosterops japonica* T. et Z.).

strict sense, lack the radial symmetry, as is the case with many flowers of the Rafflesiaceæ. They are solitary, terminal, subterete. The perianth-tube is hypogynous and firmly attached to the ovary. It is usually truncate or sometimes 4-lobed at the apex, seemingly like the perianth of *Pilostylis* and sometimes like that of *Apodanthes* (SOLMS-LAUBACH I., p. 12) but differs in being hypogynous. The perianth is 4-merous, as is seen in the very early stage of the flower-development, and also in fully developed flowers which have sometimes the perianth 4-lobed. The existence of this 4-lobed perianth in *Mitrastemon* escaped the attention of the previous authors who recorded it as having an entirely truncate tube without any lobe, which lobeless perianth they regarded as one of the peculiar characters separating the plant from the Rafflesiaceæ (HAYATA I., p. 112; MAKINO II., p. 253). Corolla none. Stamens deciduous, hypogynous, erect, connate into a cylindrical cap, entirely covering the gynæcium, as in *Pilostylis aethiopica* (LOTSY p. 881), filaments entirely connate into a broad tube, dehiscing vertically on one side. Anthers numerous connate into a broad belt-like cap which covers the stigma. Anther-cells, quite irregularly and closely arranged in many series on the above mentioned belt-like cap. They are separated by thin walls, and outer walls are especially very simple. A fibrous layer lacks entirely. They are very like those of *Pilostylis* (LOTSY p. 881, Fig. 612, 3, 4, 6). Connective-tips connate into a cap with a very small opening at the apex. Ovary, entirely superior, sessile, ovoid, one-celled, with parietal placentas, 9–13 in numbers, (or more in *M. Kawasasaki* HAY). The ovary is much like that of *Apodanthes* (SOLMS-LAUBACH I., p. 12) in its structure, but differs from it in being superior. The placentas are lamelliformed, thick, fleshy. Style, crowning the top of the ovary and articulated to it, erect, short, very thick, conical. Stigma, semi-spherico-conical, umbonate at the top with an obscure groove on one side. In shape, the style and stigma are much like those the female flowers of *Pilostylis* and *Apodanthes* (SOLMS-LAUBACH I., p. 13). Ovules, minute, obovoid-ellipsoid, with a short or long funicle, anatropous; integument, composed of a single layer of cells, as is also the case with the nucellus. The structure of ovules are very much like to that of the Rafflesiaceæ more than that of any other parasitic plants (GOEBEL II., p. 368–369;

SOLMS-LAUBACH VI.). Fruit baccate, slightly larger than the ovary, and comparable to that of the Apodantheæ. In the case of a plant which was sent from its native locality, and kept growing in a pot in a green-house here in Tōkyō, I have observed that the style which at the base is jointed to the ovary is, when the fruit is fully ripe, separated by a slit along the articulation. Seeds minute and very numerous, with a hard reticulated testa like those of rafflesiaaceous plants.

III. Inner Morphology of *Mitrastemon*, especially with regards to its systematic Position.

1. Anatomy of the intramatrical Tissue.

The intramatrical tissue of the parasite in the host root is entirely of the kind generally called a "thallus" which, in its main parts, exists in the bast of the host root. It is a formless mass just under the peduncle of a flower in the bast and soon separates into a number of threads running right and left along the long axis of the host root; anastomosing with each other, and forming a network which completely surrounds the host-root in the middle layer of the bast and on the outer side of the cambium layer. Flower peduncles are generally found most profusely on roots 1 cm. or more in diameter. From each thread of the network-thallus a number of smaller threads much finer than the preceding are sent out perpendicular to it towards the center of the xylem. For convenience sake, I shall call a thallus-thread running horizontally along the long axis of the root in the bast-region a horizontal thread, and one running vertically towards the center of the xylem a vertical thread. The horizontal threads in the bast are composed, as is seen in a cross section of the host root, of rounded plasmatic cells in the periphery, but of a elongated ones towards the center, and in most cases there are found near the center some tracheids with spiral markings. The peripheral plasmatic cells, it seems to me, are comparable to the phlöm of highly organized plants in their function, while the central somewhat elongated tracheidal cells resemble the xylem of the same in their function. Towards their ends, the threads, both vertical and horizontal,

become very much finer until at last the thread consists of a single row of cells, which is called by SOLMS-LAUBACH a mycerium-thread, on account of its resemblance to a fungus-hypha (SOLMS-LAUBACH II., GOEBEL I., p. 435). Accordingly in every cross section of a region in or near the place where a flower-peduncle stands, we shall invariably find in the bast a number (30-50) of rounded points, each distinct and remote, or sometimes coming into contact and uniting, every one of which is a cross section of a horizontal thread, arranged in a ring or two all round the xylem. Each of these points throws a perpendicular thread through the cambium layer and xylem, along a medullary ray towards the center. The surface view of the network of horizontal threads in the bast is clearly and easily observable with the naked eye in the process of removing the outer parts of the secondary bast. Therefore, the intramatrical tissue in the bast forms a cylinder-like body made of reticulated threads, which completely surrounds the xylem outside the cambium layer. It is justly comparable in some respects to that of *Cytinus* which lies in the bast as a true, perfect, but unreticulated cylinder inside the cambium layer. The thallus of *Mitrastemon* bears even more resemblance to that of *Burgmansia* (SOLMS-LAUBACH, IV.) and *Pyrostylis* (SOLMS-LAUBACH II., LOTSY p. 882). Such a structure of the intramatrical tissue is considered, at the present time, to be a character peculiar to the Rafflesiaceæ and never observed in any other family. The only connection of this tissue to one of another kind which we call a "senker," is to be found in *Arceuthobium Oxycedri*, a plant belonging to the Loranthaceæ (GOEBEL II., p. 379). The perpendicular threads are by no means terete like the horizontal, but are laterally compressed. Accordingly in the cross section of a vertical thread, which is obtainable in a tangential section of the host-root, it comes into view as a lentiform group of cells always laying side by side with a medullary ray, or sometimes laying in a group of bast cells. It is broader and thicker towards the base (i. e. the bast), but narrower and thinner towards the center of the xylem, and at last becomes a thread consisting towards the apex of a single row of cells.

Therefore, in a longitudinal section of the host-root, and also in a cross section of the same, the vertical threads always appear in the shape of an

elongated wedge with a long thread at the apex. The thread which lies deep within the xylem, after having finished its physiological function, is found dead and buried deep in the xylem. The vertical threads are composed only of rounded parenchymatous cells which are rounded at the basal portions but by and by become elongate towards the apex, especially in the apical portions which are composed of a single row of cells.

The horizontal threads become more and more slender as they recede from the flower-region, and show no more differentiation of peripheral parenchymatous and central tracheidal tissue, and in much remoter regions, say 20 or 30 cm. from the flower-regions and in the part of the root where it attains nearly 2 mm. in diameter (in main or adventive roots), they remain as threads composed each of a single row of cells in or just above the cambium-layer. This shows how widely they are spread over the host root. They are by no means straight, but always anastomosing and running in a zig-zag manner. In longitudinal sections of the host-root, they appear, not as straight lines, but as interrupted or dotted lines. The vertical threads are usually larger in parts near the floral polster, but become shorter in remoter regions. As the horizontal threads reticulate themselves, so do the vertical threads in the region of the xylem, mostly at their apical portions towards the center of the pith. There the vertical threads push out formless branches towards the apex of the host-root, along its long axis, parallel to the horizontal threads in the bast. Here we have another kind of horizontal threads which connect the vertical threads in the xylem, making an irregular network. This network is composed of irregular threads composed of single rows of rounded cells which are very much larger than those in other parts of the intramatrical tissue, and are of very irregular amoeboid shape. The vertical threads which run usually side by side with the medullary rays are easily distinguished from their companions by their having elongated rounded cells full of plasmas, with much larger unclei, and smooth and much thinner walls. The cells of the medullary rays, in contrast to those of the vertical threads, are usually rectangular, and have pitted and thicker walls. The intramatrical tissue is generally distinguished from the host tissue by its taking a much deeper stain with any staining matter, for example with

DELAFIELD's Hematoxylin solution.

While the horizontal threads in the bast sends inwards, in cross section of the host-root, one vertical thread towards the center, they push outwards two or three short branches towards the bark; but they seem to have no important function, not even of absorption.

In cross sections of a remoter part towards the host-apex, i.e. a region where the root is nearly 3-5 mm. in diameter, we find a thallus consisting of single-rowed cells near or in the cambium-layer. The cells, the outer-most one especially, of the thallus of this region are, in almost all cases, comparatively large, and each, the outermost one especially, contains 2-4 or sometimes as many as eight nuclei. The nuclei are at one time round and at another dumb-bell-shaped, sometimes curved, fusiform or elongated, and the nuclei in the same cell are of very different sizes, some being small, others quite large. They are, in my opinion, as considered from their being very variable in shape and size, and from the position of their cells, possibly formed, not by indirect, but by direct division. The nuclei just mentioned are nearly of the same shape, as those formed by amitose in the cells of Characeæ, *Tradescantia* (STRASBURGER I., p. 77, II., pp. 24-45), and in those of a root-bulbulus infected with a kind of mycorrhiza (SHIBATA, p. 644-672). Here, in the present case, the nuclei take, it seems to me, at first a very irregular amoeboid shape, then curve and fold, at last contract at the middle, and divide into two. I have also observed a case where two nuclei thus formed seemed to have come into contact and probably to have united again. Whether nuclei thus divided by amitose division have the ability to divide mitosely or whether they have that ability then first when their union is accomplished, I am not in a position to decide, nor does that question come within the purpose of the present paper. It is quite probable, however, that this amitose division has been caused by the supply of two much nourishment, just as is seen in the cells of endosperma and those of a root-bulbulus infected with a kind of mycorrhiza (STRASBURGER l. c., SHIBATA l. c.).

On comparing the tissue of the infected host-roots with that of uninfected, we find that the secondary bast of the former is usually extremely swollen, and there is no considerable amount of lamellæ of depressed sieve

tubes caused by so-called "obliteration" (TSCHIRCH p. 345); while the secondary bast of the latter is not at all swollen, and there is present a considerable amount of the depressed lamellæ of sieve tubes. We also find here that the swelling of the bast-tissue is especially large in the floral polster. This is possibly ascribable to the same cause as that to which we ascribe the similar effect in the case of galls (KERNER p. 472) and mycorrhiza (SHIBATA l. c.)

The intramatrical tissue, when fully grown, produces endogeneously a flower-bud, which breaks up the bark of the host-root, and protrudes upwards a peduncle, just as in the case of a plant of the Rafflesiaceæ. (SOLMS-LAUBACH I., p. 3; II., IV., LOTSY p. 833).

2. Structure of the Peduncle.

The peduncle of *Mitrastemon*, as is usually the case with a parasite, is extremely primitive in its anatomical structure. The tissue is formed by nearly round parenchymatous cells which are largest towards the center of the tissue mass and become gradually smaller towards the epiderm. Inter-cellular spaces are greater towards the center and smaller towards the periphery, and there are practically none at all outside of the ring of vascular bundles. The epiderm has no stoma. There are 5–10 horse-shoe shaped or semi-circular, outward-curving, vascular bundles around the central pith. They are scattering when few in number, but come into close contact, when there are many of them. Towards the epiderm on the outside of this broken ring of vascular bundles, there are sometimes seen a very few small bundles which seem to run into scales on the peduncles. There is generally in the center of a bundle, in cross section, a group of a few spiral tracheids arranged in a curved line, which is almost completely surrounded by layers of plasmatic cells. The layer of plasmatic cells is thicker on the outer side of the tracheidal bundles, than on the inner side. The cambium-layers, or rather a few cambium-cells, are found just outside of, and close to, the tracheidal-groups. The tracheidal cells here represent a primitive xylem, and the surrounding plasmatic cells an as yet undifferentiated bast. I found,

in a very few cases, very primitive ducts, annular or spiral, within the tracheidal group. I could not discover any true well-formed ducts. Neither sieve-tubes, nor companion cells, nor bast fibres, nor wood-fibres are found anywhere. There are one or two collenchymatous rather rounded rectangular cells near the bundles. The whole tissue like the host itself contains a considerable amount of tannin. The structure of the peduncles is, upon the whole, quite similar to that of *Cytinus*, differing from it only in that it lacks well-formed pitted or annular ducts.

IV. Systematic Position of *Mitrastemon*.

As is stated above, *Mitrastemon* bears a close affinity to plants at present referred to the Rafflesiaceæ and especially to those of the Apodanthææ, a tribe of the same family. It also resembles in some respects the Nepenthaceæ, Hydonoraceæ, Aristolochiaceæ and Balanophoraceæ (MAKINO II., p. 253). It comes near the Nepenthaceæ (WUNSCHMANN) in having single perianth and superior ovary; but greatly differs from it in having peculiar parasitic organs, united stamens, one-celled ovary with many parietal placentas and gamophyllous perianth. It resembles the Hydonoraceæ (SOLMS-LAUBACH V.) in its parasitism, its leafless, one-flowered-peduncles, but differs in having united stamens, one-celled ovary with many parietal placentas and berry-form fruit. Its affinity to the Aristolochiaceæ (SOLEREDER) is to be seen in the gamophyllous perianth, one-celled ovary, berry-form fruit and short columnar styles; but it is quite distinct in its parasitism, leafless peduncles and united stamens. It somewhat resembles the Balanophoraceæ (ENGLER) in having a parasitic habit, and scaly leafless flower-stalk; but the difference in floral structure is so great that it hardly needs pointing out.

As we have seen in external as well as the internal morphological characters, *Mitrastemon* has a close relation to the Rafflesiaceæ, in its absorption-organ, uniflowered leafless peduncles, tetramerous perianth, one-celled ovary with parietal placentas, short columnar style and stigma, and in the structure of its ovules. The only points which formerly led us to

hesitate to refer this plant to the Rafflesiaceæ, are its having an entirely superior ovary and mitraformed united stamens (HAYATA I., p. 112; MAKINO II., p. 253). As to the difference of the staminal structure, however, the connection of *Mitrastemon* with rafflesiacous plants is to be found in the stamens of *Pilostylis* (SOLMS-LAUBACH I., p. 13; LOTSY p. 881) where the one-celled anther-cells are arranged in a few series around the stigmatic disc, and in those of *Mitrastemon* where one-celled anthers are arranged in many series and in an irregular way on a staminal tube covering the style and stigma. Regarding the difference of the position of the ovaries, the relation is also to be found in *Apodanthes* which sometimes has a semisuperior ovary (BENTHAM et HOOKER III., p. 118). Moreover, the position of the ovary cannot by itself to be considered as a sufficiently reliable character to determine the systematic position of a family. As we see in many families in every division of phanerogamous plants, many cases occur in which plants having a superior ovary and others having an inferior ovary are included in one and the same family, and there are even cases in which plants having ovaries which are both superior and inferior are included in one and the same genus, as we see in *Asarum*, a genus of the Aristolochiaceæ. Among gamopetalous plants (BENTHAM et HOOKER II.), the following families are mentioned as those which include plants with superior and inferior ovaries:—Apocynaceæ, Campanulaceæ, Goode-niaceæ, Myrsinæ, Primulaceæ, Compositæ and Styracaceæ. Among Polypetalæ (BENTHAM et HOOKER I.): Bruniaceæ, Celastrineæ, Ficoideæ, Hamamelidaceæ, Holoragaceæ, Melastomaceæ, Myrtaceæ, Olacinaceæ, Portulacaceæ, Rhamnaceæ, Rhizophoraceæ, Rosaceæ, Samydaceæ, Saxifragaceæ and Connaraceæ. Among Monochlamydeæ, (BENTHAM et HOOKER III.):—Balanophoreæ, Chenopodiaceæ, Cupuliferæ, Lauraceæ, Monimiaceæ and Santalaceæ. Among Monocotyledones (BENTHAM et HOOKER III.): Bromeliaceæ and Liliaceæ.

As we have stated above, *Mitrastemon* is closely related to the Rafflesiaceæ in several points, and even the points which led us previously to regard it as different from the Rafflesiaceæ (HAYATA I. p. 112; MAKINO II. p. 252) do not present sufficient characters to warrant the erection of a

special family for the plant. I am, therefore, at present, strongly inclined to refer this plant to the Rafflesiaceæ. In so doing, however, it is necessary to broaden the definition formerly given to the Rafflesiaceæ (SOLMS-LAUBACH I., p. 1; ENGLER-GILG, p. 176) so far as to note that the family rarely has a superior ovary, or mitraformed united stamens.

That being done, the question arises, to what tribe of the same family should *Mitrastemon* be referred. There are, at present, three tribes, i.e. Rafflesieæ, Apodantheæ, Cytinieæ (SOLMS-LAUBACH I.). The present plant comes nearest to Apodantheæ in the shape of its perianth, ovary and stigma, but differs in having mitriformed united stamens and an entirely superior ovary. After considering the extent of the differences which separate above mentioned three tribes from one another and the points in which this plant differs from all the tribes at present known, I am driven to the conviction that it would be better to make a special tribe for it, as was once suggested by T. MAKINO, and to place it next to Apodantheæ. It is to be granted that one might refer this plant to the Apodantheæ (SOLMS-LAUBACH I., p. 8 and 12) by greatly changing the definition of that tribe. The difference between this plant and Apodantheæ is, however, sufficiently great to make it not unworthy of a special tribe of its own.

The relation of this newly established tribe to the other three, is shown below. Here, so far as is possible, I have followed SOLM's system as to the arrangement and definition of the tribes (SOLMS-LAUBACH I., p. 8.).

A. Germen floris feminei et hermaphroditæ irregulariter lacunosum inferius, ovulis ad lacunarum parietes numerosis hemianatropis, integumento unico. Columna apice dilatata antheras infra marginem gerens. Tribus I. Rafflesieæ.

B. Germen floris feminei uniloculare, placentatione parietali. inferius vel superius.

α Ovula ad parietem germinis sessilia stipitata anatropa, integumentis binis instructa. Antheræ bi-tri-verticillatæ, poro apicali transverse dehiscentes ; germen inferius.

Tribus II. Apodantheæ.

- β Ovula ad parietem germinis plus minus stipitata, anatropa, integumento unico instructa. Antheræ connatae multiseriatæ mitram formantes. Germen superius.

Tribus III. *Mitrastemoneæ*.

- γ Ovula placentis prominentibus varie divisis insidentia, atropa, integumento unico prædicta. Germen inferius.

Tribus IV. *Cytineæ*.

V. Resumé.

Mitrastemon has a close affinity to the Rafflesiaceæ in its external as well as its internal morphology. It differs from the same family in its having an entirely superior ovary and mitraform united stamens. These differences are not such as differentiate families, but are rather tribal or generic. To refer the plant to the family named, it is necessary to extend the definition formerly given to it to such an extent as to recognise that it has usually an inferior ovary but sometimes a superior ovary and mitraform united stamens. The points differentiating this plant from the three tribes we have at present in this family, are sufficiently great to make it not unworthy of having a special tribe established for it. The new tribe *Mitrastemoneæ* should be placed next to *Apodantheae*.

ICONES PLANTARUM FORMOSANARUM.

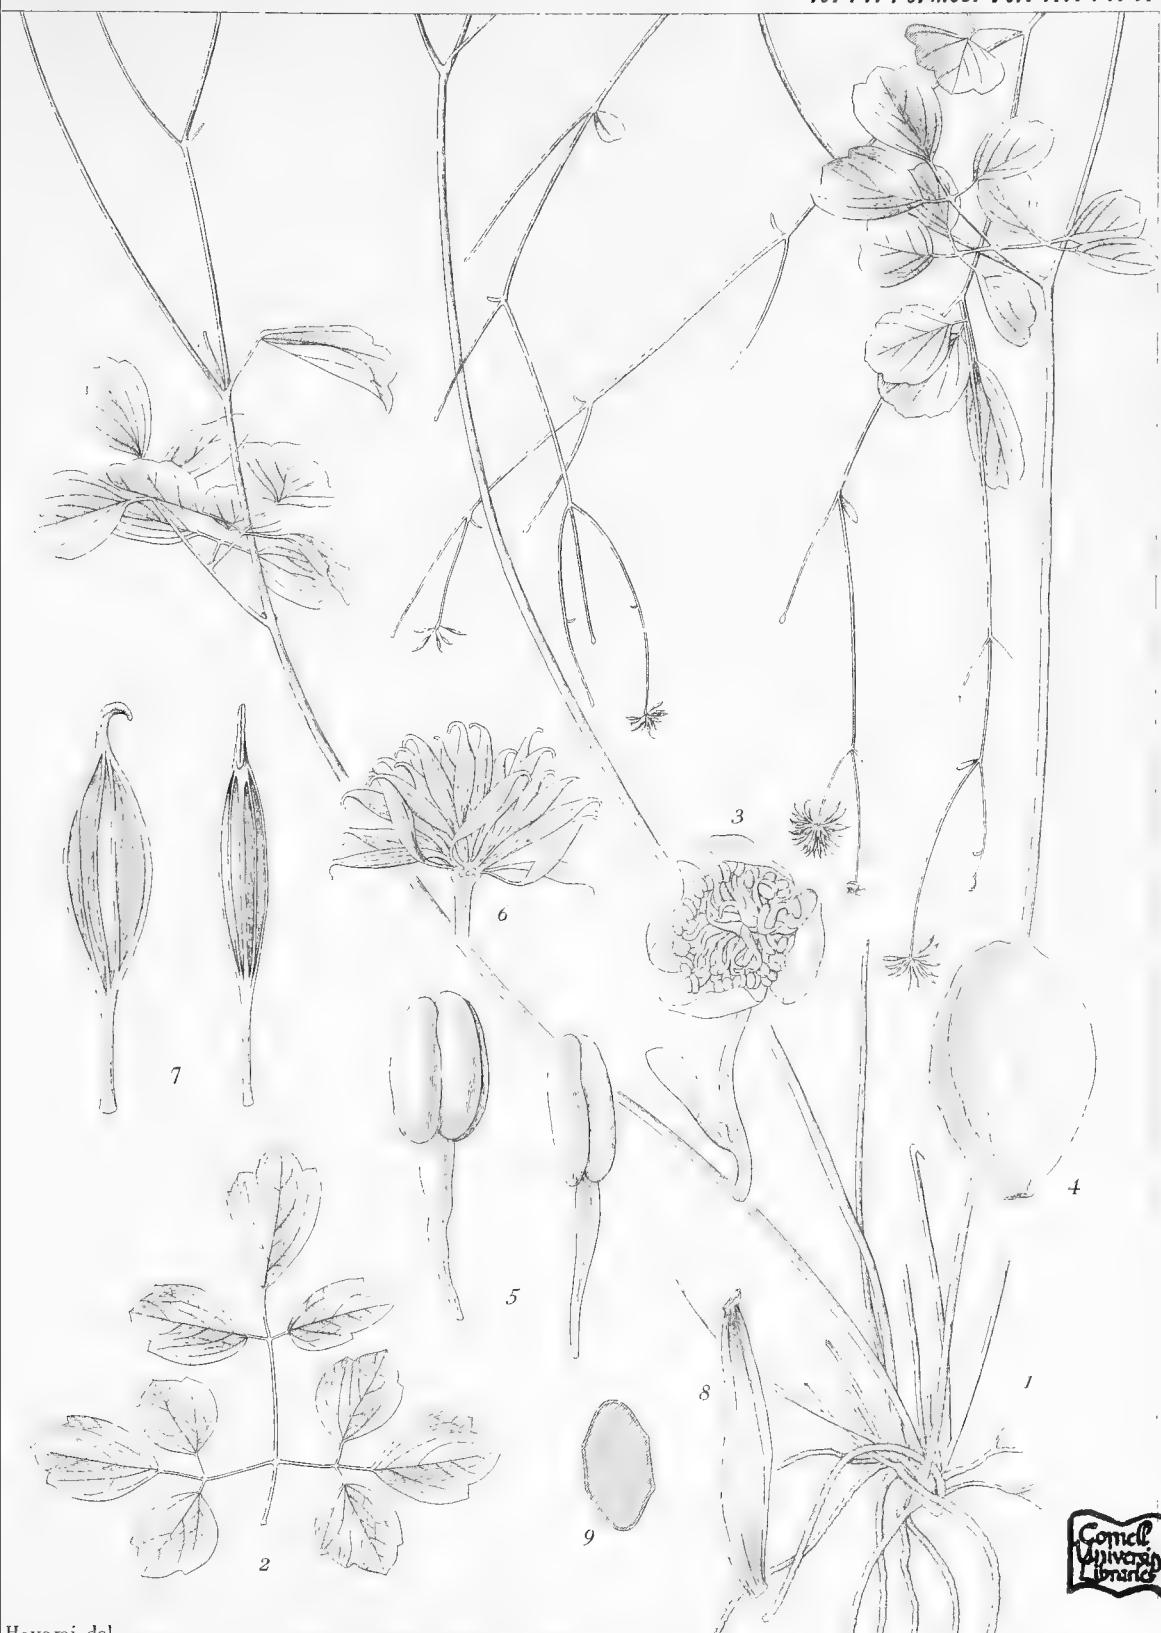

III.

PLATE I.

Explanation of Pl. I.

Thalictrum micranthum HAYATA.

- Fig. 1. The plant.
2. A leaf.
3. A flower.
4. A petal.
5. Stamens, front and lateral views.
6. Fruits.
7. Achenes, seen from different sides.
8. A seed.
9. Cross section of the same.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE II.

Explanation of Pl. II.

Coptis Morii HAYATA.

- Fig. 1. The plant.
2. A leaf.
3. A flower.
4. A sepal.
5. 6. 7. A petal, seen from different sides.
8. 9. A stamen, seen from different sides.
10. Fruits on the receptacle.
11. A fruit, expanded.
12. The same, not expanded, seen from side.
13. A seed.

ICONES PLANTARUM FORMOSANARUM.

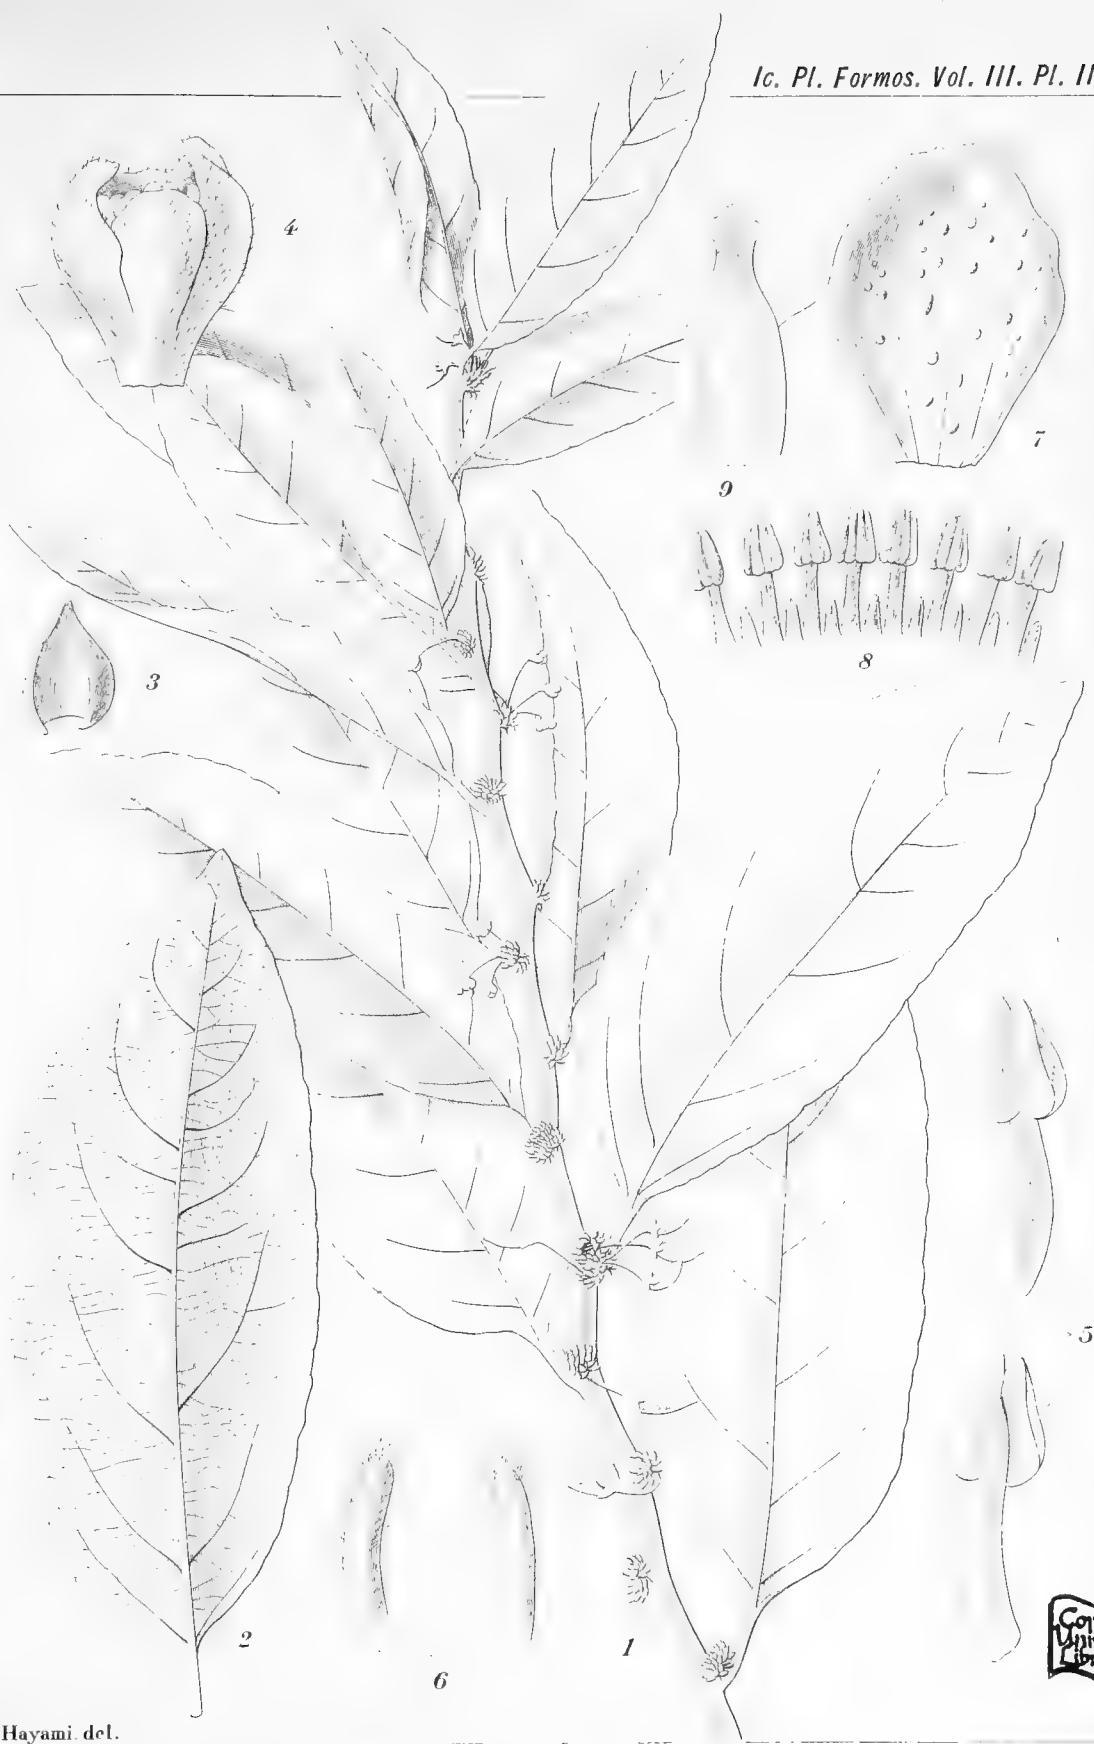

III.

PLATE III.

Explanation of Pl. III.

Casearia Merrilli HAYATA.

- Fig. 1. The plant.
2. A leaf.
3. A bract.
4. A flower.
5. Stamens, seen from different sides.
6. Staminodes.
7. A calyx-lobe.
8. Stamens and staminodes.
9. An ovary.

ICONES PLANTARUM FORMOSANARUM.

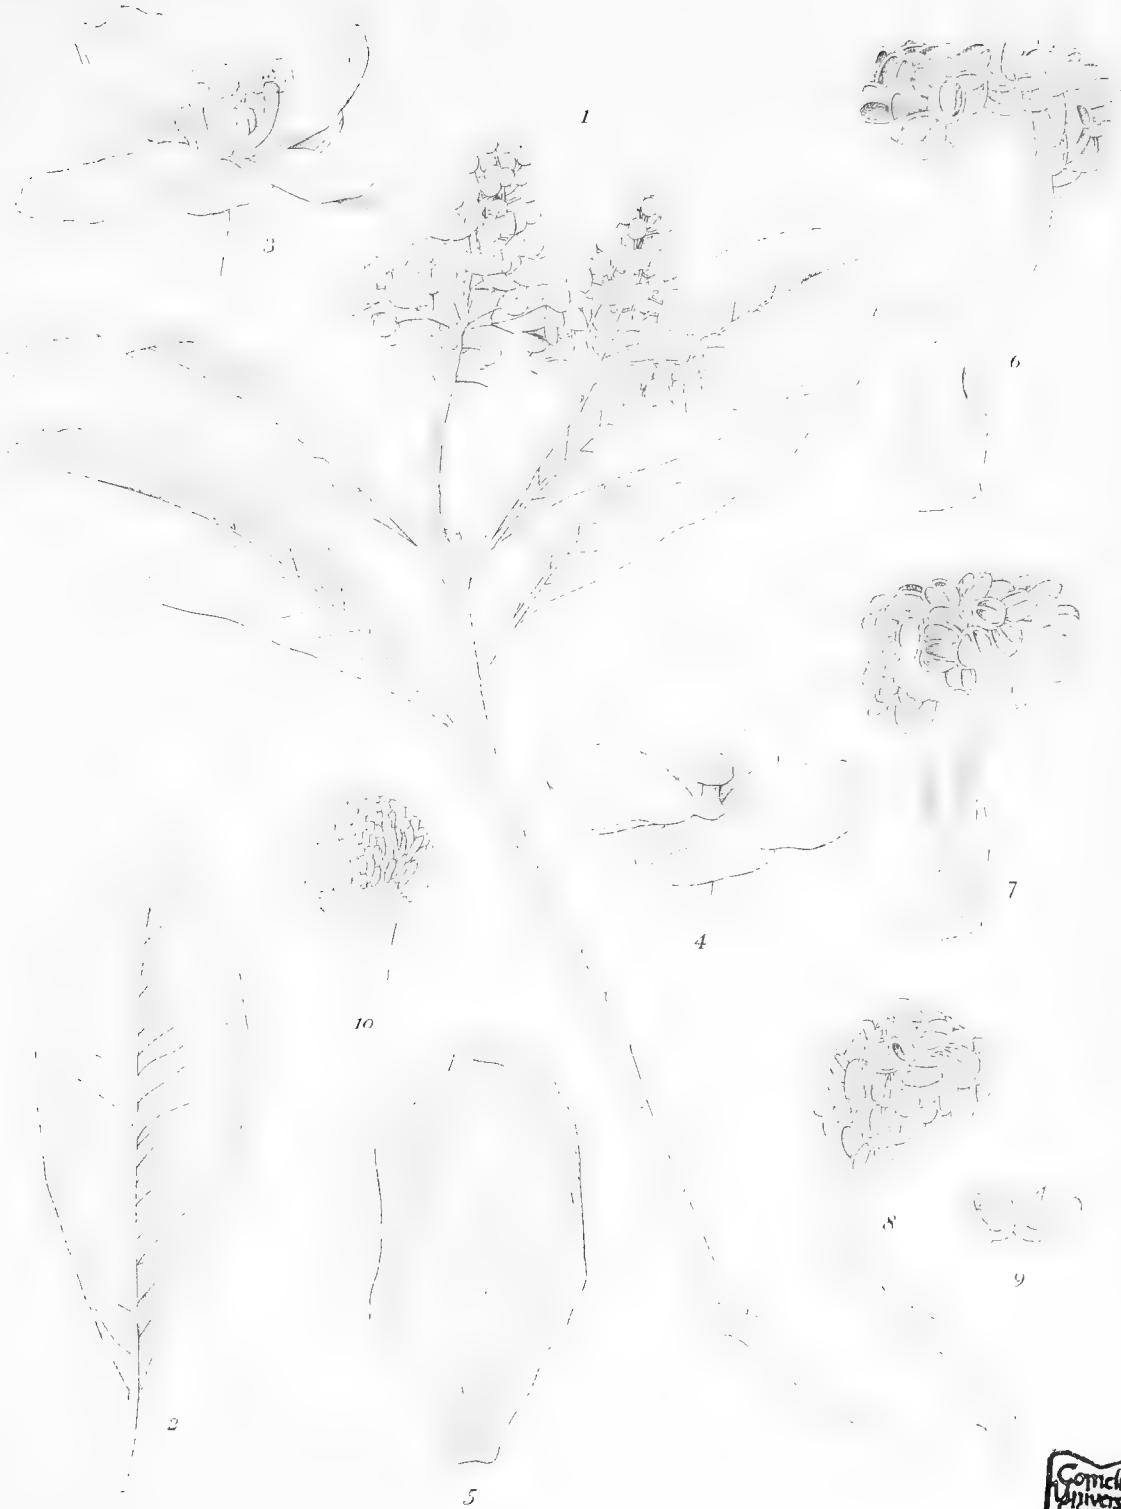

III.

PLATE IV.

Explanation of Pl. IV.

Garcinia multiflora CHAMP.

- Fig. 1. The plant.
2. A leaf.
3. A flower.
4. The same, petals and stamens taken off.
5. A petal.
6. 7. 8. Staminal bundles, seen from different sides.
9. Anther-cells.
10. A stigma of the rudimental ovary.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE V.

Explanation of Pl. V.

Anneslea fragrans WALL. var. *lanceolata* HAYATA.

- Fig. 1. The plant.
2. A leaf.
3. A flower.
4. A lower sepal.
5. A marginal portion of the same.
6. Corolla.
7. A flower, corolla and stamens taken off.
8. A petal.
9. Stamens.
10. Vertical section of an ovary.
11. Cross section of the same.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE VI.

Explanation of Pl. VI.

Thea parvifolia HAYATA.

- Fig. 1. The plant.
2. Basal portion of a flower, stamens and petals taken off.
3. A bract.
4. A sepal.
5. An inner sepal.
6. Corolla expanded.
7. 8. Stamens, seen from different sides.
9. An ovary in vertical section.
10. Apical portion of a style.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE VII.

Explanation of Pl. VII.

Chisocheton kusukusense HAYATA.

- Fig. 1. A branch.
2. A flower.
3. Staminal tube, expanded.
4. Disc-tube, expanded.
5. An ovary.
6. A fruit.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE VIII.

Explanation of Pl. VIII.

Ilex lonicerifolia HAYATA.

- Fig. 1. A branch.
2. Corolla, expanded.
3. A stamen.
4. The same, seen from another side.
5. A flower, corolla taken off.
6. The same, in vertical section.
7. Cross section of an ovary.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE IX.

Explanation of Pl. IX.

Ilex micrococca var. *longifolia* HAYATA.

- Fig. 1. A branch.
2. Portion of inflorescence.
3. A fruit.
4. The same, seen from below.
5. Cross section of the same.
• • 6. 7. Seeds, seen from different sides.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE X.

Explanation of Pl. X.

Euonymus pellucidifolius HAYATA.

- Fig. 1. A branch.
2. A leaf.
3. A flower.
4. The same, seen from below.
5. The same, in vertical section.
6. A petal.
7. 8. Stamens, seen from different sides.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE XI.

Explanation of Pl. XI.

Cassine illiciifolia HAYATA.

- Fig. 1. A branch.
2. A leaf.
3. A flower.
4. A bract.
5. A sepal.
6. Corolla, expanded.
7. A petal.
8. 9. 10. 11. 12. Stamens, seen from different sides.
13. An ovary (rudimentary).
14. Cross section of the same.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE. XII.

Explanation of Pl. XII.

Cissus pteroclada HAYATA.

- Fig. 1. The plant.
2. Cross section of the stem.
3. Part of inflorescence.
4. A flower, two petals are taken off to show the stamens and pistil.
5. Petals.
6. 7. 8. Stamens, seen from different sides.
9. An ovary.
10. Vertical section of the same.
11. Cross section of the same.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE XIII.

Explanation of Pl. XIII.

Kerroleuteria formosana HAYATA.

- Fig. 1. A leaf.
2. A leaflet.
3. A fruit.
4. A seed.
5. An embryo.
6. The same, expanded.

PLATE XIV.

Explantaion of Pl. XIV.

- A. *Acer cinnamomifolium* HAYATA.
- B. *Acer litseæfolium* HAYATA.
- C. *Acer hypoleucum* HAYATA.

- Fig. 1. A branch of *A. cinnamomifolium*.
2. A flower of the same species.
3. A branch of *A. litseæfolium*.
4. A fruit of the same species.
5. A branch of *A. hypoleucum*.
6. A fruit of the same species.

ICONES PLANTARUM FORMOSANARUM.

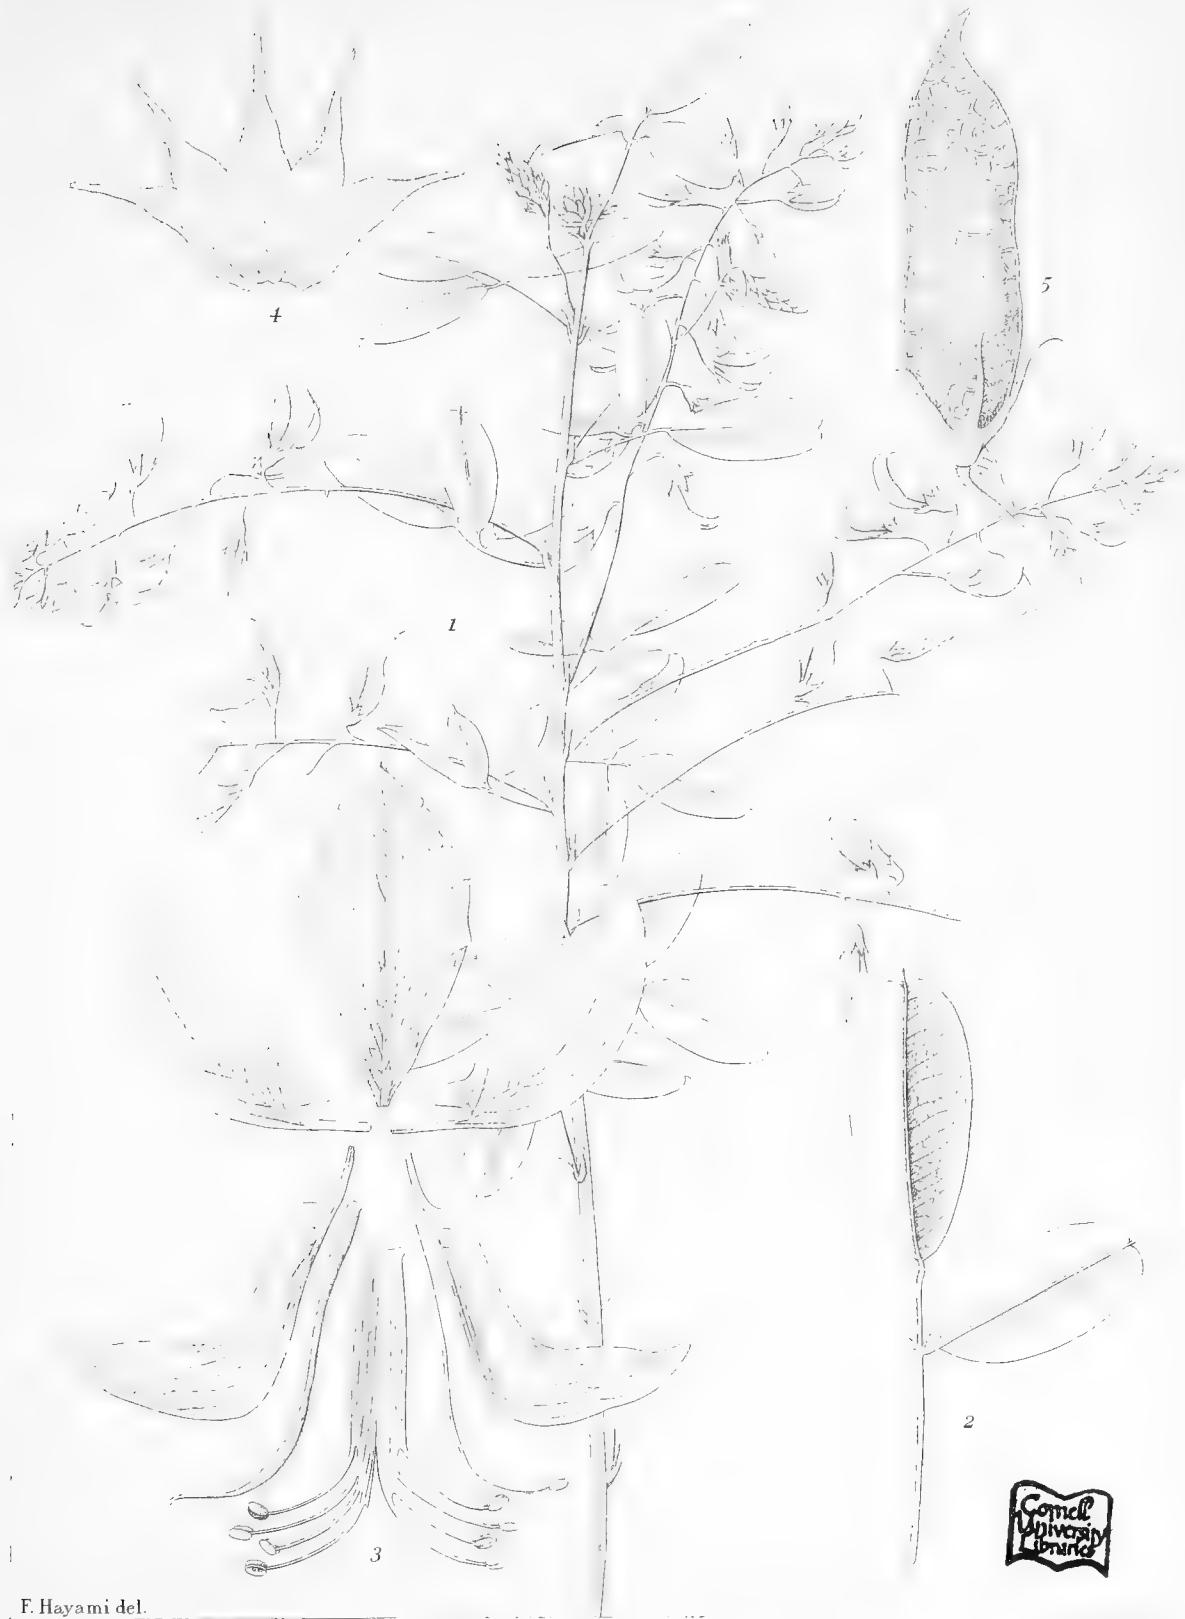

III.

PLATE XV.

Explanation of Pl. XV.

Lespedeza pseudomacrocarpa HAYATA.

- Fig. 1. A branch.
2. A leaf, one of the leaflets taken off.
3. Petals, stamens and a pistil.
4. Calyx, expanded.
5. A pod.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE XVI.

Explanation of Pl. XVI.

Euchresta Horsfieldii var. *formosana* HAYATA.

- Fig. 1. A branch.
2. Petals, stamens and pistil.
3. Apical portion of calyx (expanded).
4. A fruit.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE XVII.

Explanation of Pl. XVII.

Sanguisorba formosana HAYATA.

- Fig. 1. The plant.
2. A leaf.
3. A leaflet.
4. A flower-head.
5. A flower.
6. A bract.
7. A sepal.
8. A flower, stamens taken off.
9. 10. 11. Stamens, seen from different sides.
12. Cross section of an ovary.

ICONES PLANTARUM FORMOSANARUM.

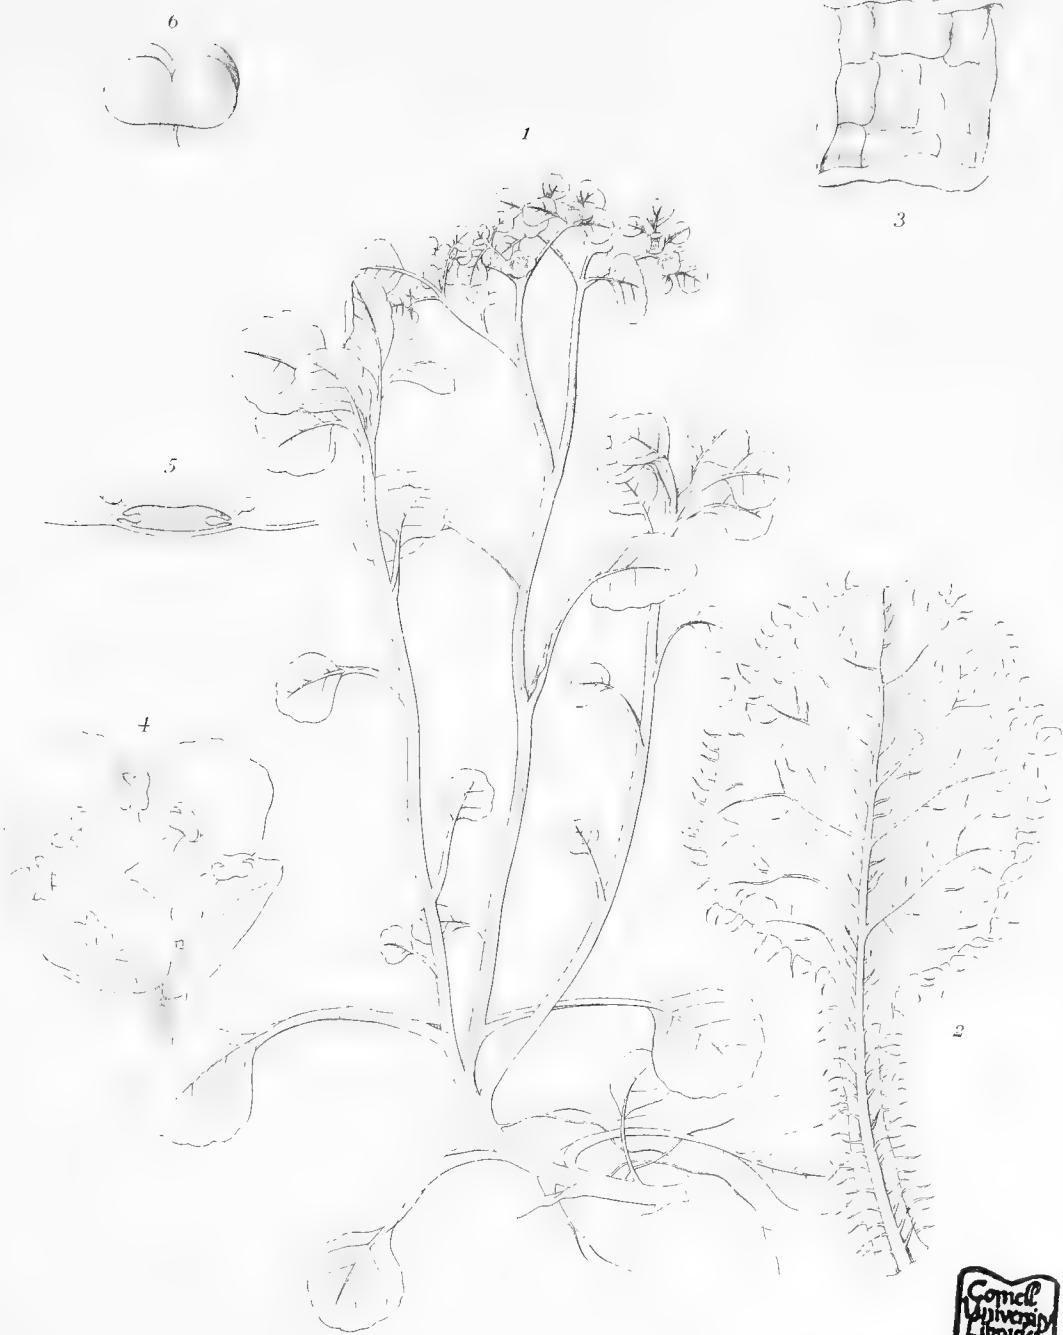

III.

PLATE XVIII.

Explanation of Pl. XVIII.

Chrysosplenium formosanum HAYATA.

- Fig. 1. The plant.
2. A leaf.
3. A flower-bud.
4. A flower, expanded.
5. Vertical section of the same.
6. A stamen.

ICONES PLANTARUM FORMOSANARUM.

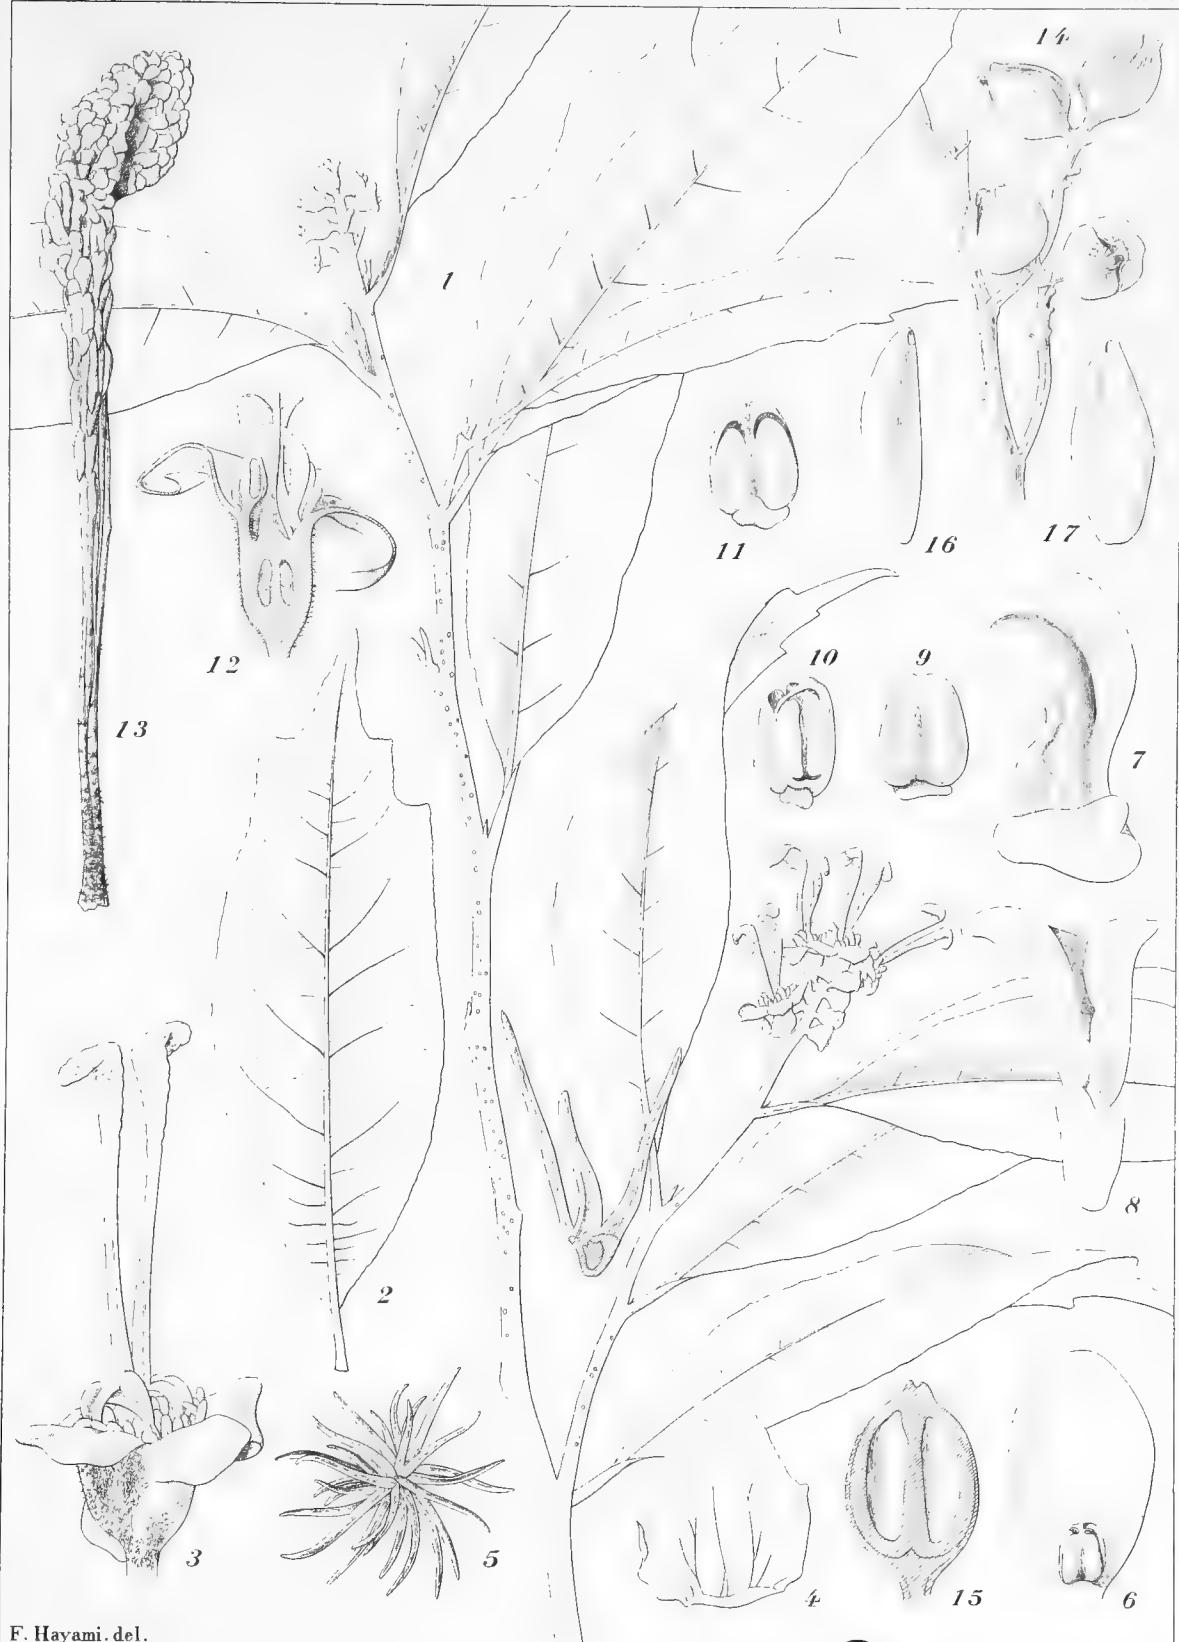

III.

PLATE XIX.

Explanation of Pl. XIX.

Eustigma oblongifolium GORDN. et CHAMP.

- Fig. 1. A branch.
2. A leaf.
3. A flower.
4. A bract.
5. A hair on the calyx.
6. A calyx-lobe with a stamen.
7. 8. Petals, seen from different sides.
9. 10. 11. Stamens, seen from different sides.
12. A flower in vertical section.
13. A style.
14. A fruit-bearing raceme.
15. Vertical section of a fruit.
16. 17. Seeds, seen from different sides.

F. Hayami. del.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE XX.

Explanation of Pl. XX.

Ceriops Candolleana ARN. var. *Sasakii* HAYATA.

- Fig. 1. A branch.
2. A leaf.
3. A flower.
4. The same, sepals and petals partially taken off; sepals, petals, stamens and a pistil are seen.
5. A sepal.
6. A petal.
7. 8. A stamen, seen from different side.
9. A pistil.

PLATE XXI.

Explanation of Pl. XXI.

Bredia scandens HAYATA.

- Fig. 1. The plant.
2. A flower.
3. The same, petals and stamens taken off.
4. A petal, seen from within.
5. The same, seen from without.
6. Calyx, expanded.
7. 8. 9. Stamens of one kind, seen from different sides.
10. 11. 12. Stamens of the other kind, seen from different sides.
13. 14. Seeds, seen from different sides.

ICONES PLANTARUM FORMOSANARUM.

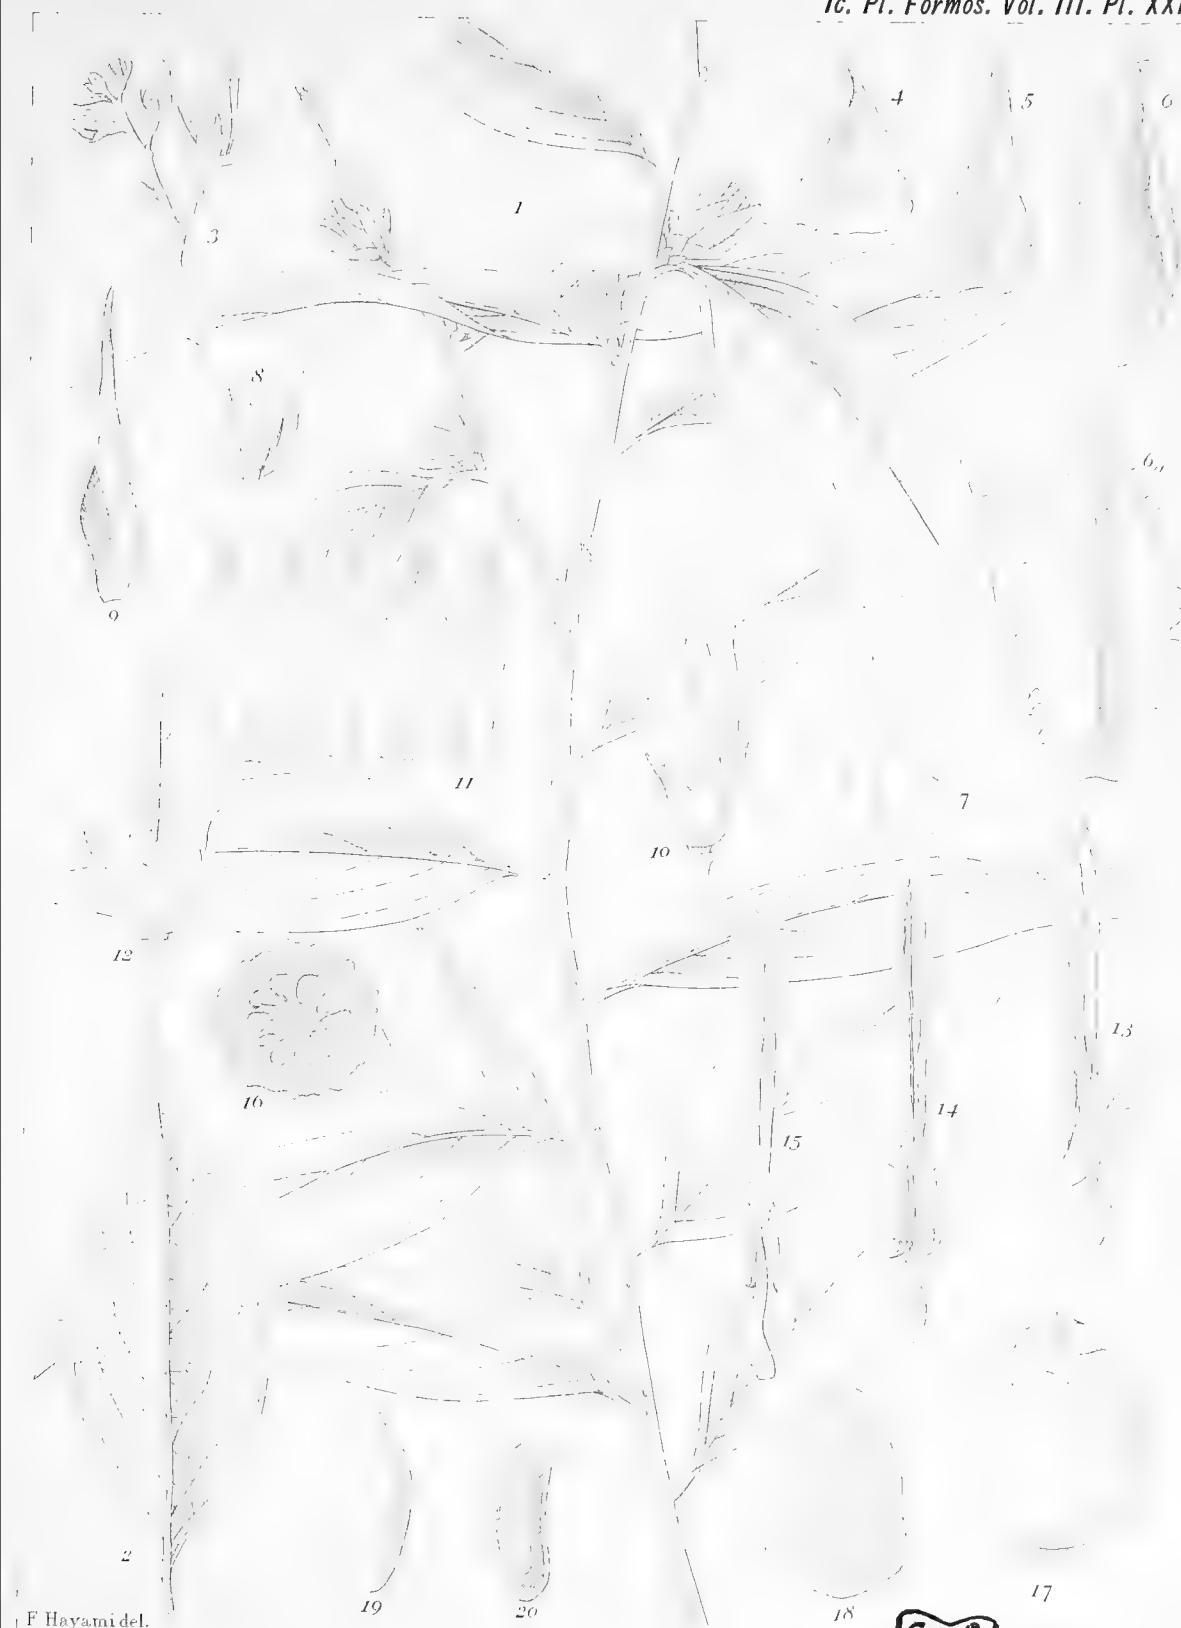

III.

PLATE XXII.

Explanation of Pl. XXII.

Vaccinium caudatifolium HAYATA.

- Fig. 1. A branch.
2. A leaf.
3. A raceme.
4. An outer scale of a bud of a raceme.
5. A middle scale of the same.
6. An inner scale of the same.
6a. The inner-most scale of the same.
7. A portion of the outer surface of the same, showing glandular hairs.
8. Two bracteoles.
9. A bract.
10. A flower.
11. Corolla, expanded.
12. Calyx and ovary.
13. 14. 15. Stamens, seen from different sides.
16. Cross section of an ovary.
17. A fruit.
18. A seed.
19. Albumen.
20. Vertical section of the same, showing an embryo.

ICONES PLANTARUM FORMOSANARUM.

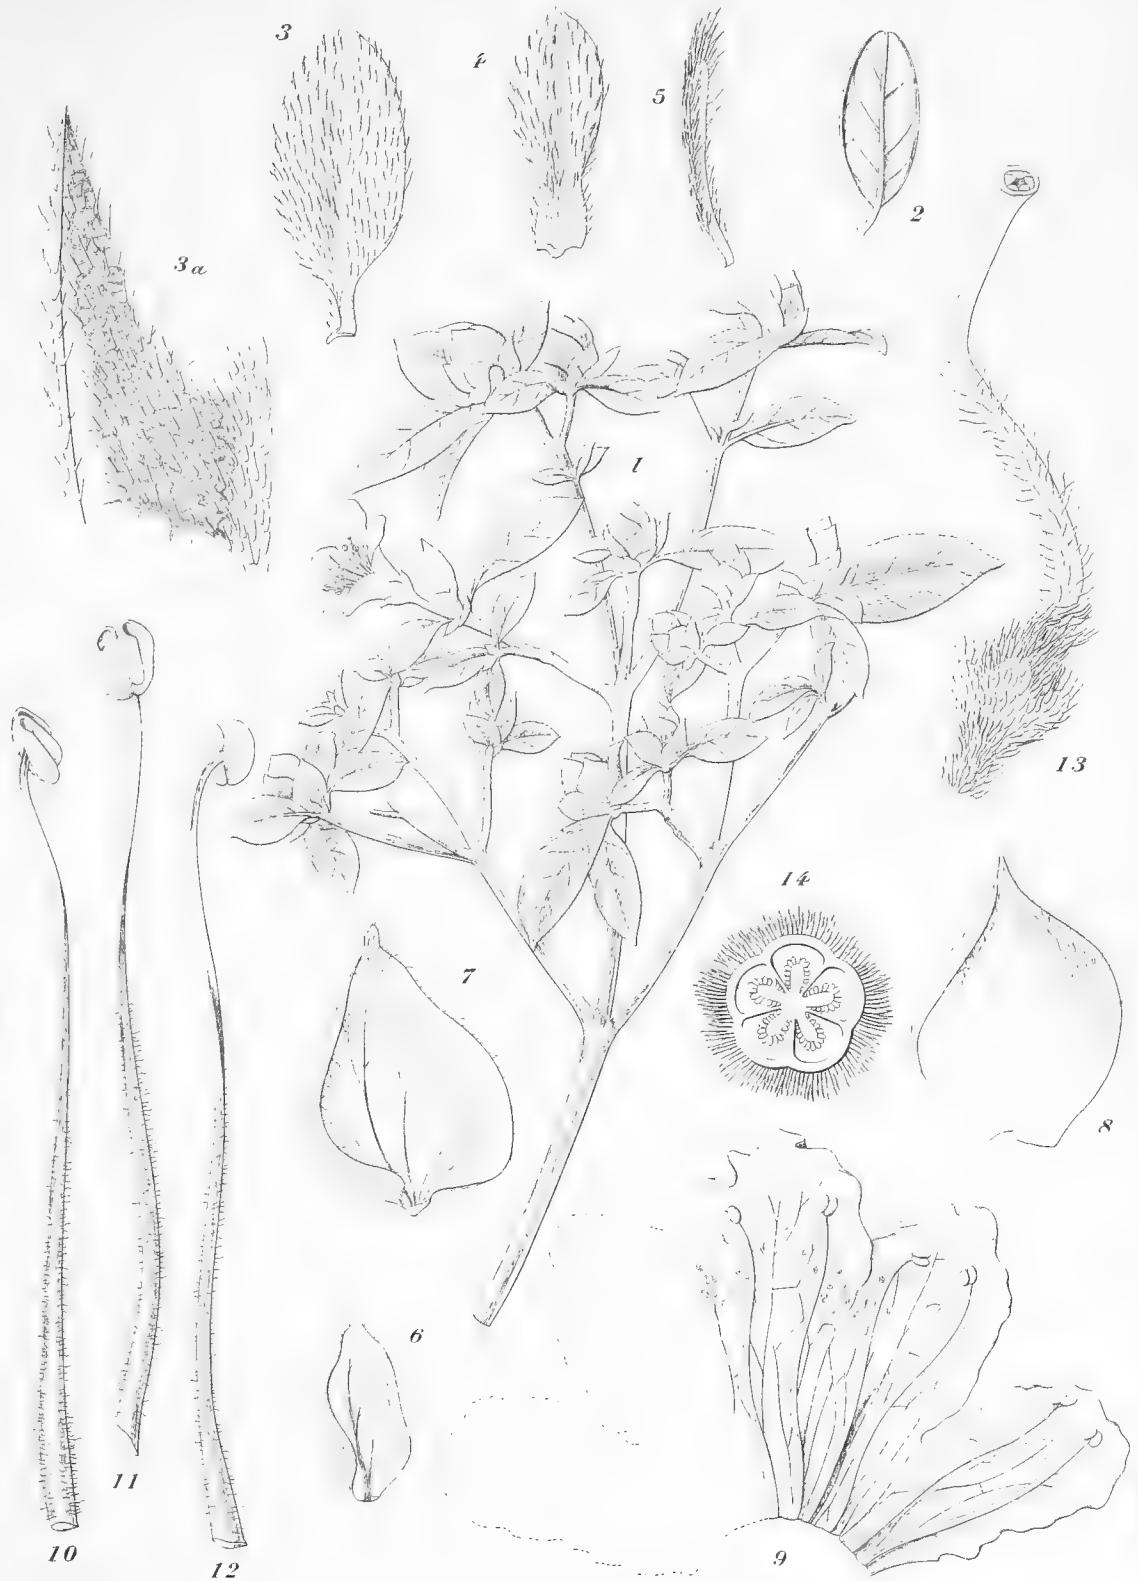

III.

PLATE XXIII.

Explanation of Pl. XXIII.

Rhododendron caryophyllum HAYATA.

- Fig. 1. A branch.
2. A leaf, showing the lower surface, (natural size).
3. The same, showing the upper surface (slightly magnified).
3a. A portion of the under surface of a leaf.
4. A bract.
5. A bracteole.
6. An outer bract.
7. An inner bract.
8. The inner-most bract.
9. Corolla, expanded.
10. 11. 12. Stamens.
13. An ovary.
14. Cross section of the same.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE XXIV.

Explanation of Pl. XXIV.

Rhododendron leiopodium HAYATA.

- Fig. 1. A branch.
2. A leaf.
3. A flower, expanded.
4. 5. 6. 7. Bracts, outer to inner.
8. 9. 10. Stamens.
11. An ovary.
12. Stigma.
13. Cross section of an ovary.

ICONES PLANTARUM FORMOSANARUM.

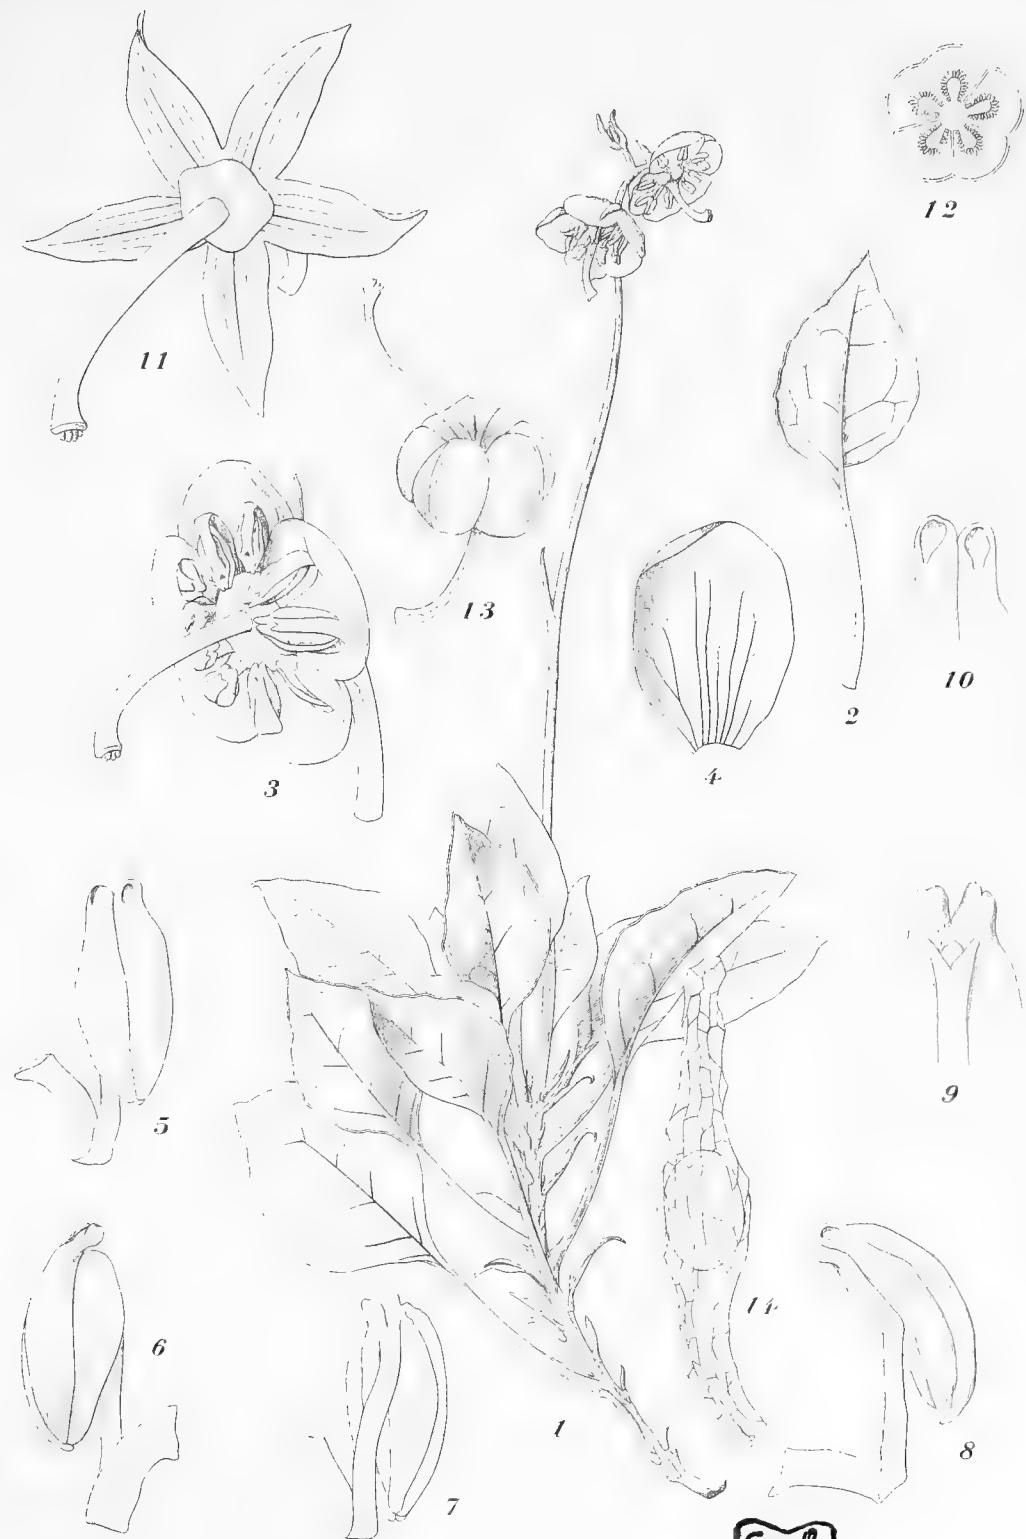

III.

PLATE XXV.

Explanation of Pl. XXV.

Pyrola albo-reticulata HAYATA.

- Fig. 1. The plant.
2. A leaf.
3. A flower.
4. A petal.
5. 6. 7. 8. Stamens, seen from different sides.
9. 10. Apical portions of a stamen, seen from different sides.
11. A flower, petals and stamens, taken off.
12. Cross section of an ovary.
13. A fruit.
14. A seed.

ICONES PLANTARUM FORMOSANARUM.

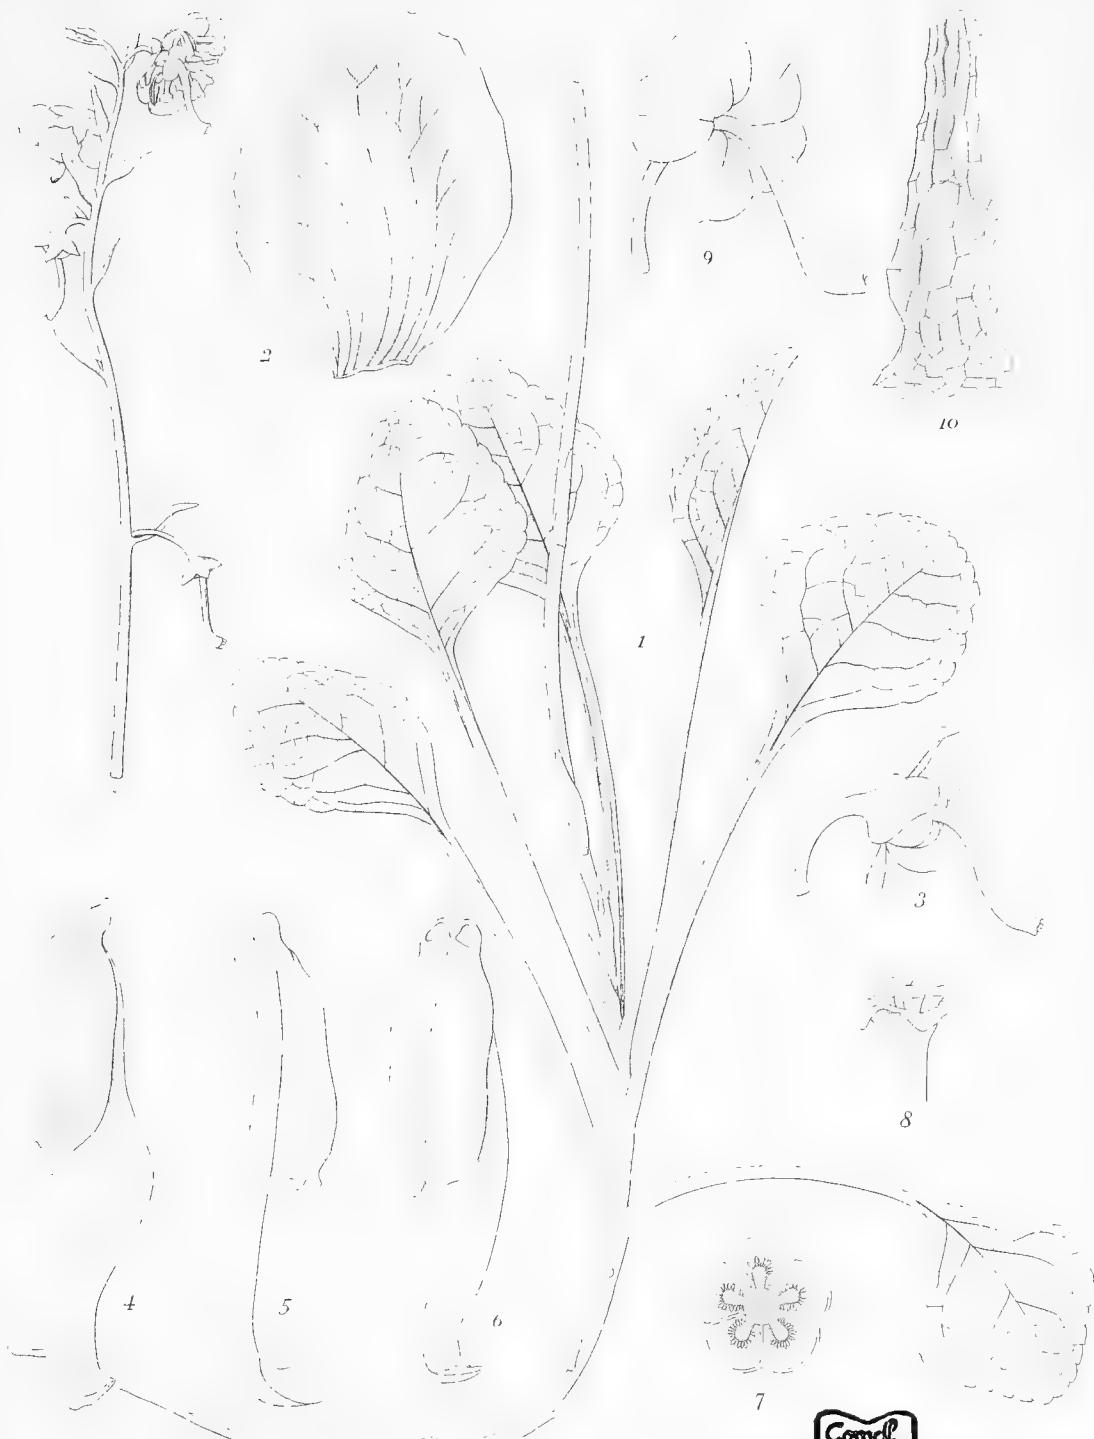

III.

PLATE XXVI.

Explanation of Pl. XXVI.

Pyrola morrisonensis HAYATA.

- Fig. 1. The plant.
2. A petal.
3. A flower, petals and stamens taken off.
4. 5. 6. Stamens, seen from different sides.
7. Cross section of an ovary.
8. Apical portion of a style.
9. A fruit.
10. A seed.

ICONES PLANTARUM FORMOSANARUM.

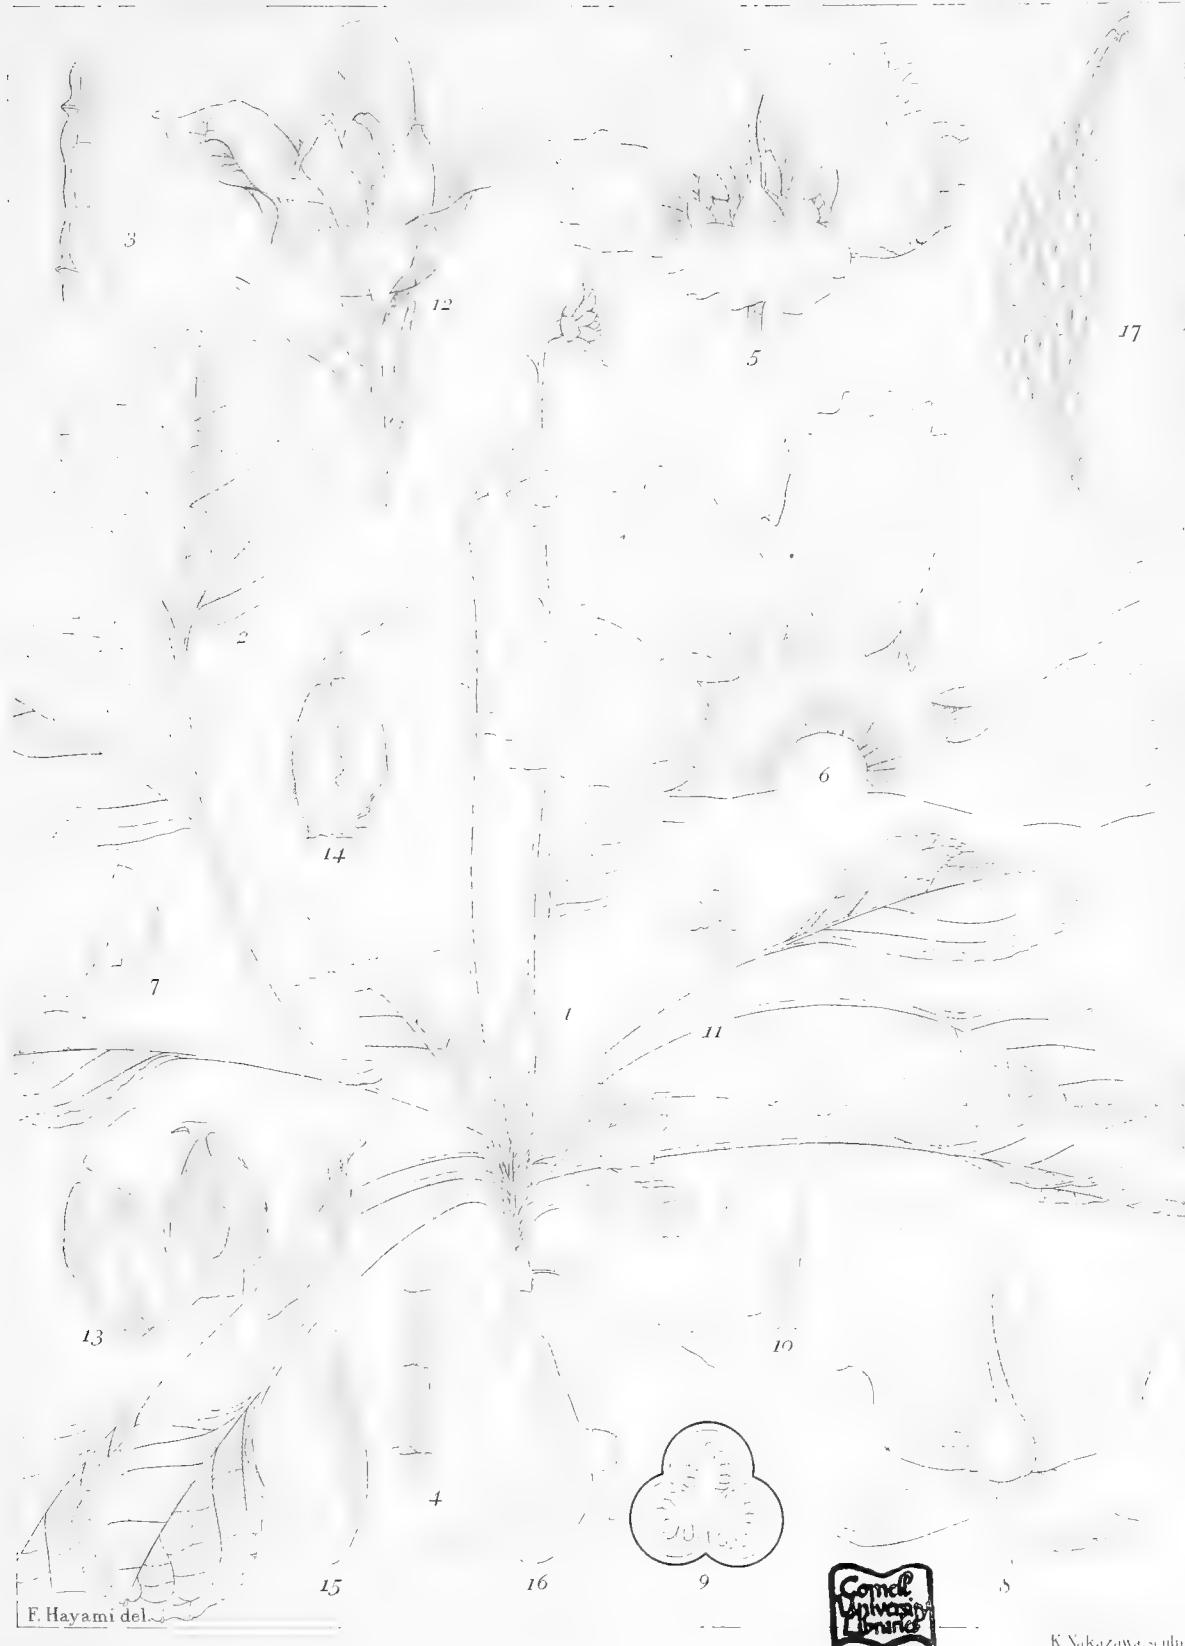

III.

PLATE XXVII.

Explanation of Pl. XXVII.

Shortia exappendiculata HAYATA.

- Fig. 1. The plant.
2. A leaf.
3. A marginal portion of a leaf, seen from below.
4. The same, seen from above.
5. A flower.
6. Corolla, expanded.
7. A stamen.
8. A flower, corolla and stamens taken off.
9. Cross section of an ovary.
10. An ovule.
11. Apical portion of a style, showing the stigma.
12. A fruit.
13. Valves of the same.
14. A valve.
15. 16. Seeds, seen from different sides.
17. Portion of the seed-coat, showing its reticulation.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE XXVIII.

Explanation of Pl. XXVIII.

Chionanthus serrulatus HAYATA.

- Fig. 1. A branch.
2. A leaf.
3. Calyx.
4. A flower.
5. Corolla, expanded.
6. 7. 8. Stamens, seen from different sides ; the attaching parts
of the filaments to the corolla are shaded.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE XXIX.

Explanation of Pl. XXIX.

Fagræa Sasakii HAYATA.

- Fig. 1. A branch.
2. A leaf.
3. A flower.
4. Corolla, expanded.
5. A corolla-lobe.
6. 7. Stamens, seen from different sides.
8. An ovary.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE XXX.

Explanation of Pl. XXX.

Machilus longipaniculata HAYATA.

- Fig. 1. A branch.
2. A leaf.
3. A flower.
4. A sepal.
5. An inner sepal.
6. Limb of the calyx, expanded.
7. 8. 9. Stamens of one kind, seen from different sides.
10. 11. 12. Staminodes of one kind.
13. 14. 15. Staminodes of the other kind.

PLATE XXXI.

Explanation of Pl. XXXI.

Balanophora mutinoides HAYATA.

- Fig. 1. A male plant.
2. Portion of the flower-head, seen from above.
3. A male flower.
4. The same, seen from above.
5. A female plant.
6. A portion of the flower-head.
7. A columella with female flowers at its base.
8. The same in cluster.
9. Cross section of a female flower-head.

PLATE XXXII.

Explanation of Pl. XXXII.

Ulmus Uyematsui HAYATA.

- Fig. 1. A branch.
2. A leaf.
3. Calyx and stamens, expanded.
4. A young fruit.
5. A seed.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE XXXIII.

Explanation of Pl. XXXIII.

A. = *Carpinus minutiserrata* HAYATA.

- Fig. 1. A branch.
2. A half of a leaf, showing its under surface.
3. 4. 5. Fruit-bearing bracts seen from different sides, (in 4, a fruit taken off.).
6. A fruit.

B. = *C. Kawakamii* HAYATA.

- Fig. 1. A branch.
2. A half of a leaf.
3. 4. 5. Fruit-bearing bracts, seen from different sides, (in 4, a fruit taken off.).
6. A fruit.

ICONES PLANTARUM FORMOSANARUM.

III.

PLATE XXXIV.

Explanation of Pl. XXXIV.

Pinus brevispica HAYATA.

- Fig. 1. A branch with flowers and cones.
2. A two-leaved branchlet.
3. Basal portion of the same.
4. A male flower-bud.
5. 6. Bracts of the same.
7. A male flower.
8. 9. 10. Stamens, seen from different sides.
11. A cone.
12. A scale, taken from the middle portion of the cone (n. s.).
13. A winged seed, (n. s.).
14. A scale taken from the middle portion of a cone, (nearly two times).
15. 16. The same, seen from within, one with seeds, the other without seeds.
17. A seed, seen from side, (magnified).

ICONES PLANTARUM FORMOSANARUM.

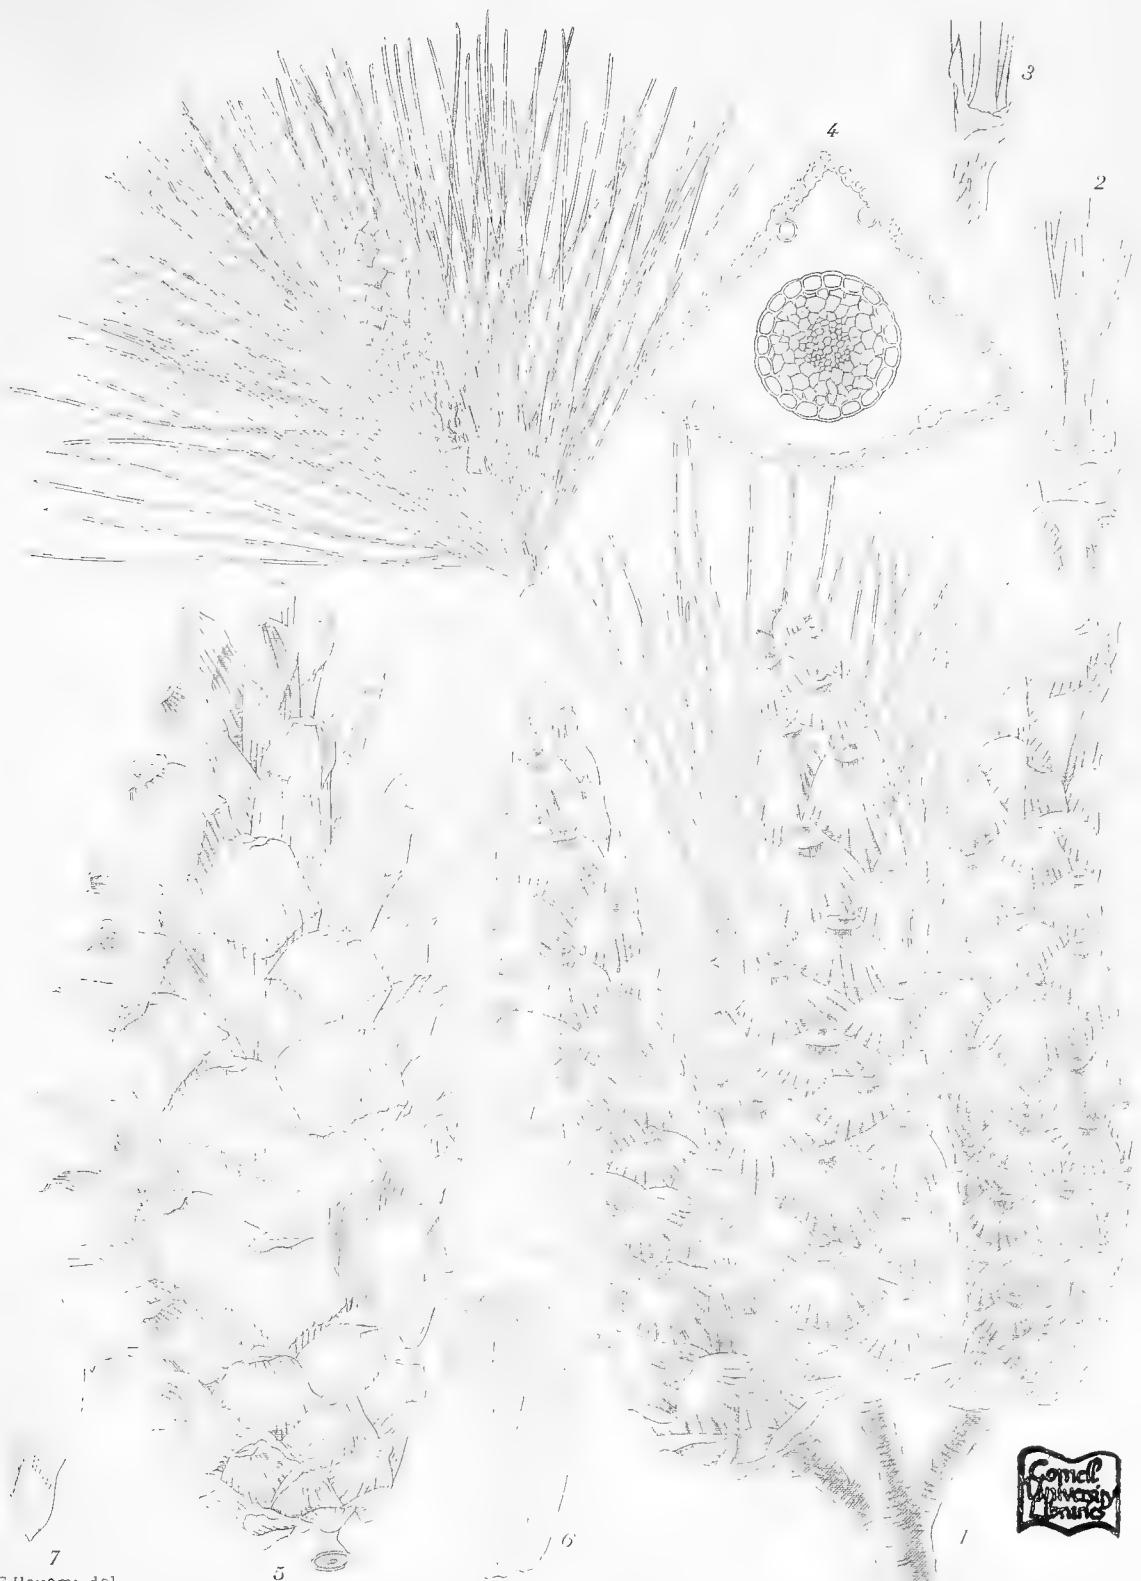

III.

PLATE XXXV.

Explanation of Pl. XXXV.

Pinus Uyematsui HAYATA.

- Fig. 1. A cone-bearing branch.
2. Basal portion of a five leaved branchlet, seen from front.
3. The same, seen from side.
4. Cross section of a leaf.
5. A cone, after dissemination.
6. A scale taken from the middle portion of the cone (n. s.).
7. A seed (n. s.).
